| 2.5 Hand Washing.....                                                             | 21     |
| 2.6 Household Population and Composition .....                                    | 21     |
| 2.7 Birth Registration .....                                                      | 22     |
| 2.8 Death Registration.....                                                       | 23     |
| 2.9 Children's Living Arrangements and Parental Survival.....                     | 23     |
| 2.10 Schooling .....                                                              | 21     |
| 2.10.1 Educational Attainment.....                                                | 21     |
| 2.10.2 Preschool Attendance.....                                                  | 22     |
| 2.10.3 School Attendance .....                                                    | 23     |
| 2.11 Disability.....                                                              | 24     |
| 2.12 Use of Tobacco and Alcohol.....                                              | 25     |
| 2.13 Possession of Mosquito Nets.....                                             | 28     |

|                  |                                                        |            |
|------------------|--------------------------------------------------------|------------|
| <b>CHAPTER 3</b> | <b>CHARACTERISTICS OF RESPONDENTS .....</b>            | <b>79</b>  |
| 3.1              | Basic Characteristics of Survey Respondents .....      | 79         |
| 3.2              | Schooling and Literacy .....                           | 80         |
| 3.3              | Mass Media Exposure .....                              | 81         |
| 3.4              | Employment .....                                       | 83         |
| 3.5              | Occupation .....                                       | 83         |
| <b>CHAPTER 4</b> | <b>FERTILITY AND FERTILITY PREFERENCES .....</b>       | <b>111</b> |
| 4.1              | Current Fertility.....                                 | 111        |
| 4.2              | Children Ever Born and Living .....                    | 113        |
| 4.3              | Birth Order .....                                      | 113        |
| 4.4              | Birth Intervals .....                                  | 114        |
| 4.5              | Age at First Birth.....                                | 114        |
| 4.6              | Menstrual Protection .....                             | 115        |
| 4.7              | Bathing Practices During Menstrual Period .....        | 116        |
| 4.8              | Teenage Childbearing .....                             | 116        |
| 4.9              | Desire for Another Child.....                          | 118        |
| 4.10             | Ideal Family Size.....                                 | 119        |
| 4.11             | Fertility Planning Status .....                        | 120        |
| 4.12             | Wanted Fertility Rates.....                            | 120        |
| <b>CHAPTER 5</b> | <b>FAMILY PLANNING .....</b>                           | <b>157</b> |
| 5.1              | Contraceptive Knowledge and Use .....                  | 157        |
| 5.2              | Source of Modern Contraceptive Methods.....            | 161        |
| 5.3              | Informed Choice.....                                   | 162        |
| 5.4              | Discontinuation of Contraceptives .....                | 162        |
| 5.5              | Exposure to Family Planning Messages.....              | 163        |
| 5.6              | Demand for Family Planning .....                       | 163        |
| 5.7              | Hysterectomy .....                                     | 165        |
| <b>CHAPTER 6</b> | <b>OTHER PROXIMATE DETERMINANTS OF FERTILITY .....</b> | <b>207</b> |
| 6.1              | Marital Status .....                                   | 207        |
| 6.2              | Age at First Marriage .....                            | 208        |
| 6.3              | Consanguineous Marriages .....                         | 209        |
| 6.4              | Age at First Sexual Intercourse .....                  | 210        |
| 6.5              | Recent Sexual Activity.....                            | 211        |
| 6.6              | Insusceptibility to Pregnancy .....                    | 211        |
| 6.7              | Pregnancy Outcomes.....                                | 212        |
| 6.7.1            | Characteristics of Abortions.....                      | 213        |
| <b>CHAPTER 7</b> | <b>INFANT AND CHILD MORTALITY .....</b>                | <b>241</b> |
| 7.1              | Infant and Child Mortality.....                        | 242        |
| 7.2              | Biodemographic Risk Factors .....                      | 243        |
| 7.3              | Perinatal Mortality .....                              | 244        |
| <b>CHAPTER 8</b> | <b>MATERNAL HEALTH.....</b>                            | <b>259</b> |
| 8.1              | Pregnancy Registration .....                           | 260        |
| 8.1.1            | Registration of Pregnancies.....                       | 260        |
| 8.1.2            | Mother and Child Protection Card (MCP Card).....       | 260        |
| 8.2              | Antenatal Care Coverage and Content .....              | 260        |
| 8.2.1            | Skilled Providers .....                                | 260        |
| 8.2.2            | Timing and Number of ANC Visits .....                  | 261        |

|                   |                                                                  |            |
|-------------------|------------------------------------------------------------------|------------|
| 8.3               | Components of ANC Visits.....                                    | 263        |
| 8.4               | Protection against Neonatal Tetanus .....                        | 263        |
| 8.5               | Ultrasound Testing during Pregnancy .....                        | 264        |
| 8.6               | Delivery Services .....                                          | 264        |

### MESSAGE

It gives me immense pleasure to release the National Report of the Fifth Round of the National Family Health Survey (NFHS-5), 2019-21. As with previous rounds, the much-awaited NFHS-5 estimates will help to understand the current levels and track the performances of various flagship programmes launched by the Government of India in the recent years and will help to adapt and frame new policies and plans for the future.

The NFHS-5 provides the much needed estimates on fertility, mortality, maternal, child and adult health, women and child nutrition etc. at the National and State levels. A majority of these indicators are also provided for 707 districts of India. These indicators throw light on important aspects of family well-being of the population of different States/UTs. I am also happy to note that NFHS-5 provides information on number of indicators covered in the Sustainable Development Goals (SDGs), which India is committed to.

The inclusive efforts of the Government of India in the country through landmark programmes like National Rural Health Mission, Janani Shishu Suraksha Karyakram, Swachh Bharat Abhiyan, Ayushman Bharat- Pradhan Mantri Jan Arogya Yojana (PMJAY), Mission Indradhanush, Pradhan Mantri Surakshit Matritva Abhiyan, POSHAN Abhiyaan, Beti Bachao- Beti Padhao, Pradhan Mantri Jan Dhan Yojana, Pradhan Mantri Ujjwala Yojna, promotion of menstrual hygiene among adolescent girls, etc. are also positively reflected in the findings of the NFHS-5.

Since our objective is to transform quality of life through effective delivery services, I hope that these estimates would enable the Government and stakeholders to arrive at a informed decision-making and policy interventions related to areas of health, population resources, and nutritional levels of women and children, and help in taking corrective measures in the right direction for the general population of this large and diverse country

### MESSAGE

It gives me great satisfaction and delight to bring out National Report of National Family Health Survey (NFHS-5), 2019-21 conducted under the aegis of the Ministry of Health and Family Welfare, Government of India. The NFHS-5, provides crucial information on several new and emerging issues on reproductive and child health, fertility and family planning, menstrual hygiene among adolescent girls, antenatal care, Women's empowerment, domestic violence, etc.

The estimates of key indicators given under NFHS-5 are also aligned with various Sustainable Development Goals (SDGs) especially SDG-3, which says 'Ensure healthy lives and promote well-being for all at all ages'. It provides a useful demographic and health database, which will facilitate better monitoring of government programmes, and the progress made towards achieving the SDGs by 2030.

The Government of India, under the valuable guidance of Hon'ble Prime Minister Shri Narendra Modi ji, is committed to meet the health needs of the people of India. Availability of the data generated under NFHS-5, Government would be enabled to take important policy decisions and strategies for intervention at state and district levels. Also, it will provide helpful insights to researchers who are working in the area of health, population resources, and nutritional levels of women children.

I congratulate the officials of Ministry of Health & Family Welfare, NFHS-5 team, IIPS, other partners from USAID, ICF and all who have helped in NFHS-5 for making this valuable contribution to the development of the community and country at large and wish them the best for future endeavors'.

### FOREWORD

The National Family Health Surveys (NFHS) conducted under the aegis of the Ministry of Health & Family Welfare has played a crucial role in providing the Government of India and the stakeholders with reliable inputs to monitor the progress of various flagship programmes as well as the vision of the National Health Policy. The NFHS-5, with a reference period 2019-2021 provides vital information on reproductive and child health, fertility and family planning, health insurance, nutrition, HIV/AIDS, non-communicable diseases and many other related issues. The National report provides information at National and State levels by background characteristics. The report would strengthen the country's demographic and health database, and the information will serve as a benchmark for government's initiatives in its commitment to achieve the Sustainable Development Goals (SDGs) by 2030.

Over the years, NFHS has expanded its scope and coverage to fill the gap in the data requirements of the Government, entities outside the Government and researchers in the field of population and health. Like in the previous round, NFHS-5 has adopted a modular approach to arrive at estimates of crucial indicators at the National and State /UT levels and a subset of these indicators at the district level. This will act as a useful trigger to prioritize action to address key healthcare challenges facing the districts and states.

I am also happy to note that majority of the programmes of the Ministry are successfully reflected in the findings of the report, which gives us the opportunity to further strengthen the programmes.

The success of such a large-scale survey of national importance like NFHS-5 has been due to the efforts of Statistics Division in the Ministry of Health and Family Welfare, International Institute for Population Sciences (IIPS), National AIDS Research Institute (NARI), the Chairman & Members of the Technical and Administrative Committees, USAID and ICF. I appreciate the support and contribution of all who have helped to accomplish this ambitious task.

### PROLOGUE

I am happy to note that the National Family Health Survey (NFHS) has been instrumental in providing robust information to the Government of India and policy makers with credible evidence from its various flagship programs launched by the Government in recent years and will facilitate in adopting and formulating new policies and plans for the future. The fifth round of the NFHS, conducted during 2019-21, provides crucial information on reproductive and child health, including social-economic characteristics, fertility, early child mortality, family planning, water and sanitation, nutritional status, child immunization, gender based violence, women's empowerment, certain non-communicable diseases (NCDs), and many other topics. The NFHS-5 National Report, jointly prepared by Statistics Division of MoHFW and International Institute for Population Sciences (IIPS), Mumbai, would further strengthen the country's demographic and health database.

Despite of all the challenges during the pandemic, the National Family Health Survey has committed to provide crucial database to take important policy decisions and to plan strategies for intervention at State and District level across the country. Another significant contribution of NFHS-5 is to provide recent estimates of over 34 SDG indicators for tracking the progress made and would help the government to plan towards achieving the SDGs by the year 2030.

Similar to the previous round, NFHS-5 also covered 707 districts by adopting a modular approach to arrive at estimates of crucial indicators at National, State/Union Territory (UT) and District levels. After rigorous rounds of mapping and listing of all the households in the selected first units in each State/UT, information was collected from each selected households and from women age 15-49 and men age 15-54 in each selected household, including biomarkers from all eligible persons through the use of Computer-Assisted Personal Interviewing (CAPI).

I want to congratulate the NFHS team at Statistics Division of MoHFW and IIPS, Mumbai for making this valuable contribution to the development of the community and country at large. I acknowledge with appreciations all those who have supported and contributed to the success of the project. I look forward to the comments for further value addition.

(Vikas Sheel)

## PREFACE

The National Family Health Survey (NFHS), initiated in the early 1990s, has emerged as a nationally important data source on population, health and nutrition for India and its States and UTs. The 2019-21 National Family Health Survey is the fifth in the series of national health surveys and will provide information on key health and family welfare related indicators and on several new and emerging issues including pre-school attendance, death registration, disability insurance coverage, ownership of physical and economic assets by women, domestic violence during pregnancy, height, weight, hemoglobin levels, blood pressure and blood glucose measured. For the first time in NFHS-5 waist and hip circumference measurements has also been collected. The scope of NFHS-5 has been modified to make the target population ranges aligned with those of Sustainable Development Goals (SDGs).

The survey used a uniform sampling design, questionnaires (translated into regional languages), field procedures and biomarker measurements for facilitating comparability across the States/UTs and ensuring the good data quality. NFHS-5 covered all 28 States, 08 Union Territories and 707 districts of India by adopting a modular approach to arrive at estimates of crucial indicators at National, State/Union Territory (UT) and District levels. One National factsheet, 36 States and UTs Factsheets and 707 districts factsheets that provided estimates of 131 key indicators at State/UT level and 104 at district level have already been released.

We are pleased to release NFHS-5 National report. I hope that the information given in this report will provide inputs for policy makers and planners to make informed decisions for managing effectively health and family welfare programmes with an emphasis on issues related to maternal and child health.

#### MESSAGE

I am delighted to note that the Ministry of Health and Family Welfare (MoHFW), Government of India in association with International Institute for Population Sciences (IIPS), Mumbai is bringing out the National Report of the fifth round of National Family Health Survey (NFHS-5). NFHS surveys are well recognised globally for the detailed presentation of information on India's population, health and associated domains. The estimates provided by NFHS are comparable with the Demographic Health Surveys (DHS) being carried out at over 90 countries globally.

The key estimates from NFHS are crucial in monitoring the existing policies and programmes and to formulate new ones for the betterment of the marginalised and underdeveloped communities at the grass-root level. The fieldwork of the fifth round of NFHS was conducted in two phases from June, 2019 to April, 2021 covering information from 6,36,699 households throughout the country making it one of the largest household surveys in the entire globe. Further, detailed information was collected from 7,24,115 women and 1,01,839 men in the eligible age groups. One of the major advantages of NFHS-5 is that it provides key estimates for all the States/UTs and all 707 districts (as on March, 2017), which would further help in making focused interventions at the district levels. NFHS-5 is able to provide information on important indicators, which are helpful in tracking the progress of Sustainable Development Goals (SDGs) at various levels for SDG 1 "No Poverty", SDG 2 "Zero Hunger", SDG 3 "Good Health and Well-being" and SDG 5 "Gender Equality".

I sincerely acknowledge the contribution of the army of field investigators who collected crucial information from the households and managed to complete this massive task despite COVID-19 pandemic. I would also like to convey my gratitude to the officers and officials at the MoHFW, IIPS, the ICF International, various Field Agencies, the Chairman, Co-Chairman and members of various technical committees involved in the conduct of NFHS-5 for the successful completion of this mammoth task.

(P. Manoj Kumar)

**ACKNOWLEDGEMENTS**

The National Family Health Survey (NFHS-5) was successfully completed in 707 districts (as on March 2017) drawn from all the 29 States and 7 Union Territories. The national report of the National Family Health Survey (NFHS-5) has been completed with joint efforts and involvement of numerous organizations and individuals in two phases, including the phase of a difficult period of COVID-19 pandemics. With the completion of the national report of NFHS-5, the unit-level data will be available for the use of the researchers and policy planners.

At the outset, we are grateful to the officials of the Ministry of Health and Family Welfare, Government of India, New Delhi, for their overall guidance and support. I express our sincere thanks to Shri. Rajesh Bhushan, Secretary of Health and Family Welfare, Shri Vikas Sheel, AS&MD, Ashish Srivastava AS&FA, Smt. Sandhya Krishnamurthy DG(Stats.), Shri P Manoj Kumar CD (Stats.), and Ms. Nidhi Satija JD (Stats.). The involvement of many former officials of the MoHFW helped significantly towards the completion of the survey on time. They include Preeti Sudan former Secretary, Ms. Vandana Gurnani, former AS&MD, Dr. D. S. Gangwar, former AS&FA, Smt Nivedita Gupta, former CD(Stats.), Shir D.K. Ojha, former DDG (Stats.)

I express our sincere gratitude to all the Steering Committee, Administrative & Financial Management Committee, Project Management Committee, and the Technical Advisory Committee, especially the Chairperson, Dr. N.S. Sastry and Co-Chair, Dr. Arvind Pandey for their contribution and for providing valuable guidance at different stages of implementation. The members of these committees provided constant guidance in carrying out the task even during the pandemic.

I deeply appreciate the efforts of all the Principal Investigators (Prof. S. K. Singh, Prof. Hemkothang Lhungdim, Prof. Chander Shekhar, Prof. Laxmi Kant Dwivedi, and Dr. Sarang Pedgaonkar) at IIPS for their dedication, enthusiasm and unstinting efforts in bringing out the national report on time. Prof Balram Paswan (Rtd) was actively involved in the project in the early stages. I appreciate and acknowledge the untiring efforts and initiative taken by Dr. Fred Arnold, Dr. Sunita Kishor, and other staff members/consultants of ICF at every stage of the project. We also acknowledge the contribution of NFHS-5 Senior Project Officers, Project Officers, and other staff members for their constant support. The administrative staff at IIPS provided support at all stages of the project.

I sincerely thank the Heads and staff of Field Agencies (FAs) for successfully carrying out the task of data collection in their respective states. This acknowledgment cannot be completed without expressing our appreciation for the hard work put in by the field teams in data collection and maintaining the quality of data.

(Prof. K S JAMES)

## INTRODUCTION

The National Family Health Survey 2019-21 (NFHS-5), the fifth in the NFHS series, provides information on population, health, and nutrition for India, each state/union territory (UT), and for 707 districts as on March 31<sup>st</sup> 2017. All five NFHS surveys have been conducted under the stewardship of the Ministry of Health and Family Welfare (MoHFW), Government of India. MoHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for all the rounds of NFHS. Funding for NFHS-5 was provided by the MoHFW, Government of India. ICF, USA provided technical assistance through the Demographic and Health Surveys (DHS) Program, which is funded by USAID. Assistance for the Dried Blood Sample (DBS) component of the survey was provided by the Indian Council of Medical Research (ICMR) and the National AIDS Research Institute (NARI), Pune. NFHS-5 fieldwork for India was conducted in two phases— Phase-I from 17 June 2019 to 30 January 2020 covering 17 states and 5 UTs and Phase-II from 2 January 2020 to 30 April 2021 covering 11 states and 3 UTs — by 17 Field Agencies and gathered information from 636,699 households, 724,115 women, and 101,839 men.

The first NFHS was conducted in 1992-93 and covered all states except Sikkim. NFHS-2 was conducted in 1998-99 in all states with similar content and methods to those in NFHS-1. In addition, NFHS-2 provided information on reproductive health, women's autonomy, and domestic violence, women's and children's nutrition, anaemia, and salt iodization. NFHS-3 built on the strengths and successes of NFHS-1 and NFHS-2 by maintaining continuity in content and methods with an additional component of community-based HIV testing in the country. It also included a men's interview for the first time. With additional components of CAB (clinical, anthropometric, and biochemical testing), NFHS-4 has contents similar to NFHS-3, maintaining the continuity and comparability in information. However, NFHS-4 provided information at the district level through increasing the sample size by nearly fivefold as compared with NFHS 3. NFHS-4 used a modular approach, where the last four sections of woman's questionnaire, interviews with men, and HIV testing were done only for the households included in the state module, and the information is provided only at the state level for those indicators.

Like NFHS-4, NFHS-5 also provides district-level estimates for many important indicators. The contents of NFHS-5 are similar to NFHS-4 to allow comparisons over time. However, NFHS-5 includes some new topics, such as preschool education, disability, access to a toilet facility, death registration, bathing practices during menstruation, and methods and reasons for abortion. The scope of clinical, anthropometric, and biochemical testing (CAB) has also been expanded to include measurement of waist and hip circumferences, and the age range for the measurement of blood pressure and blood glucose has been expanded. However, HIV testing was not included in NFHS-5. The NFHS-5 sample was designed to provide national, state/union territory (UT), and district level estimates of various indicators covered in the survey. However, estimates of indicators of sexual behaviour; husband's background and woman's work; HIV/AIDS knowledge, attitudes, and behaviour; and domestic violence are available only at the state/union territory (UT) and national level.

As in the earlier rounds, the MoHFW, Government of India, designated the International Institute for Population Sciences, Mumbai, as the nodal agency to conduct NFHS-5. The main objective of each successive round of the NFHS has been to provide high-quality data on health and family welfare and emerging issues in this area. NFHS-5 data will be useful in setting benchmarks and examining the progress the health sector has made over time. Besides providing evidence for the effectiveness of ongoing programmes, the data from NFHS-5 help in identifying the need for new programmes with an area specific focus and identifying groups that are most in need of essential services.

## 1.1 SURVEY OBJECTIVES

The primary objective of the 2019-21 round of National Family Health Surveys is to provide essential data on health and family welfare, as well as data on emerging issues in these areas, such as levels of fertility, infant and child mortality, maternal and child health, and other health and family welfare indicators by background characteristics at the national and state levels. Similar to NFHS-4, NFHS-5 also provides information on several emerging issues including perinatal mortality, high-risk sexual behaviour, safe injections, tuberculosis, non-communicable diseases, and the use of emergency contraception.

The information collected through NFHS-5 is intended to assist policymakers and programme managers in setting benchmarks and examining progress over time in India's health sector. Besides providing evidence on the effectiveness of ongoing programmes, NFHS-5 data will help to identify the need for new programmes in specific health areas.

The clinical, anthropometric, and biochemical (CAB) component of NFHS-5 is designed to provide vital estimates of the prevalence of malnutrition, anaemia, hypertension, high blood glucose levels, and waist and hip circumference, Vitamin D3, HbA1c, and malaria parasites through a series of biomarker tests and measurements.

## 1.2 SAMPLE DESIGN

Decisions about the overall sample size required for NFHS-5 were guided by several considerations, paramount among which was the need to produce indicators at the district and/or state/union territory (UT) levels. Thus, NFHS-5 provides information for 707 districts, 28 states, and 8 union territories.

A uniform sample design, which is representative at the national, state/union territory, and district level, was adopted in each round of the survey. Each district is stratified into urban and rural areas. Each rural stratum is sub-stratified into smaller substrata which are created considering the village population and the percentage of the population belonging to scheduled castes and scheduled tribes (SC/ST). Within each explicit rural sampling stratum, a sample of villages was selected as Primary Sampling Units (PSUs); before the PSU selection, PSUs were sorted according to the literacy rate of women age 6+ years. Within each urban sampling stratum, a sample of Census Enumeration Blocks (CEBs) was selected as PSUs. Before the PSU selection, PSUs were sorted according to the percentage of SC/ST population. In the second stage of selection, a fixed number of 22 households per cluster was selected with an equal probability systematic selection from a newly created list of households in the selected PSUs. The list of households was created as a result of the mapping and household listing operation conducted in each selected PSU before the household selection in the second stage. In all, 30,456 Primary Sampling Units (PSUs) were selected across the country in NFHS-5 drawn from 707 districts as on March 31<sup>st</sup> 2017, of which fieldwork was completed in 30,198 PSUs.

NFHS-5 was designed to provide information on sexual behaviour; husband's background and women's work; HIV/AIDS knowledge, attitudes, and behaviour; and domestic violence only at the state level (in the state module), while indicators in the district module are reported at the district level. A subsample of 15 percent of households was selected for the implementation of the state module drawn from the district sample. In 15 percent of households randomly selected for the state module, a long questionnaire was administered that included all the questions needed for district-level estimates plus additional questions for the topics listed above. To achieve a representative sample of 15 percent of households, NFHS-5 conducted interviews in every alternate selected household in 30 percent of the randomly selected clusters.

The NFHS-5 sample is a stratified two-stage sample. The 2011 census served as the sampling frame for the selection of PSUs. PSUs were villages in rural areas and Census Enumeration Blocks (CEBs) in urban areas. PSUs with fewer than 40 households were linked to the nearest PSU. Within each rural stratum, villages were selected from the sampling frame with probability proportional to size (PPS). In each stratum, six approximately equal substrata were created by crossing three substrata, each created based on the estimated number of households in each village, with

two substrata, each created based on the percentage of the population belonging to scheduled castes and scheduled tribes (SCs/STs). Within each explicit sampling stratum, PSUs were sorted according to the prevalence of literacy of women age 6+ years. The final sample PSUs were selected with PPS systematic sampling.

In urban areas, CEB information was obtained from the Office of the Registrar General and Census Commissioner, New Delhi. CEBs were sorted according to the percentage of the SC/ST population in each CEB, and sample CEBs were selected with PPS systematic sampling.

In every selected rural and urban PSU, a complete household mapping and listing operation was conducted prior to the main survey. Selected PSUs with an estimated number of at least 300 households were segmented into segments of approximately 100-150 households. Two of the segments were randomly selected for the survey using systematic sampling with probability proportional to segment size. Therefore, an NFHS-5 cluster is either a PSU or a segment of a PSU. In the second stage, in every selected rural and urban cluster, 22 households were randomly selected with systematic sampling. A detailed description of sampling design, weight computation, estimation of standard errors, and strategies to enhance data quality measures is presented in Volume II of the national report.

### 1.3 QUESTIONNAIRES

Four survey schedules/questionnaires—Household, Woman, Man, and Biomarker—were canvassed in 18 local languages using Computer Assisted Personal Interviewing (CAPI). In the Household Questionnaire, information was collected on all usual members of the household and visitors who stayed in the household the night before the interview. Basic demographic information was collected on the characteristics of each person listed, such as age, sex, marital status, schooling, ownership of an *Aadhaar* card, tobacco use, alcohol consumption, disabilities, and relationship to the head of the household. At the household level, information was collected on socio-economic characteristics; water, sanitation, and hygiene; water treatment; type of toilet facilities; type of cooking fuel; materials used for the floor, roof, and walls of the dwelling unit; ownership of various durable goods; health insurance coverage; land ownership; number of deaths in the household in the two years preceding the survey; and the ownership and use of mosquito nets. The parents' survival status was determined for children under age 18. For children under age five, information was collected on whether each child has a birth certificate or whether the birth was registered with the civil authority. The information on age and sex of household members obtained in the Household Questionnaire was used to identify women and men who were eligible for individual interviews. The Household Questionnaire also collected information on the ownership and use of mosquito nets, exposure to second-hand smoke, and the reported prevalence of tuberculosis. A sample of cooking salt used in the household was tested for iodine content. The protocol for the NFHS-5 survey, including the content of all the survey questionnaires, was approved by the IIPS Institutional Review Board and the ICF Institutional Review Board. The protocol was also reviewed by the U.S. Centers for Disease Control and Prevention (CDC).

The Woman's Questionnaire collected information from all eligible women age 15-49, who were asked questions on a large variety of topics, including the following:

- Background characteristics: age, literacy, schooling, religion, caste/tribe, media exposure
- Reproduction: children ever born, birth history, current pregnancy, pregnancy terminations
- Prevalence of hysterectomy
- Menstrual hygiene (for women age 15-24 years)
- Family planning: knowledge and use of contraception, sources of contraceptive methods, information on family planning
- Contacts with community health workers
- Maternal and child health, breastfeeding, and nutrition: antenatal care; delivery care; postnatal care; postpartum amenorrhoea; breastfeeding and child feeding practices; vaccination coverage; prevalence and treatment of diarrhoea; symptoms of acute respiratory infection (ARI), and fever; use of oral rehydration therapy (ORT); utilization of ICDS services

- Marriage and sexual activity: marital status, age at first marriage, lifetime number of unions, polygyny, consanguinity, age at first sexual intercourse, recent sexual activity, number and type of sexual partners, use of condoms
- Fertility preferences: desire for more children, ideal number of children, gender preferences for children, intention to use family planning
- Husband's background and woman's work: husband's age, schooling, and occupation, and the woman's employment and type of earnings (state module subsample only)
- Women's empowerment: household decision making, mobility, use of a bank account and a mobile phone, ownership of a house or land, barriers to medical treatment (state module subsample only)
- HIV/AIDS: knowledge of HIV and AIDS, knowledge of methods of HIV transmission, sources of HIV information, ways to avoid HIV, previous HIV testing, HIV stigma, other sexually-transmitted infections (state module subsample only)
- Other health issues: tobacco and alcohol use, knowledge of tuberculosis, current morbidity (diabetes, hypertension, asthma, goitre and other thyroid diseases, heart disease, cancer), and household decision making (state module subsample only)
- Domestic violence: only one eligible woman per household was randomly selected to answer the questions in the domestic violence section to comply with ethical requirements. Women who were victims of domestic violence were provided with a list of appropriate local organizations that they could contact if they wanted help (women age 18-49 in the state module subsample only)

The Man's Questionnaire was administered only in the subsample of households selected for the state module. The Man's Schedule covered the man's characteristics, media exposure, marriage, employment, presence at antenatal care visits, number of children, contraceptive knowledge and use, fertility preferences, nutrition, sexual behaviour, attitudes toward gender roles, HIV/AIDS, health issues, attitudes towards gender roles, tobacco and alcohol use, knowledge of tuberculosis, current morbidity (diabetes, asthma, goitre and other thyroid diseases, heart disease, cancer), and household decision making.

The Biomarker Schedule covered measurements of height, weight, and haemoglobin levels for children; measurements of height, weight, waist and hip circumference, and haemoglobin levels for women age 15-49 years and men age 15-54 years; and blood pressure and random blood glucose levels for women and men age 15 years and over. In addition, women and men were requested to provide a few additional drops of blood from a finger prick for laboratory testing for HbA1c, malaria parasites, and Vitamin D3.

In contrast to the data collection procedure for the household and individual interviews, data related to the biomarkers were initially recorded on the Biomarker Questionnaire and subsequently entered into the interviewers' mini-computers. Sample copies of all four questionnaires are presented in Volume – II of the national report.

## 1.4 BIOMARKER MEASUREMENTS AND TESTS

NFHS-5 carried out several biomarker measurements and tests with the help of trained health investigators in each team. The list of biomarkers and tests administered for NFHS-5 along with the type of instrument used are presented in the box below.

Except for HbA1c, malaria parasites, and Vitamin D3 testing, the results of all measurements and tests were immediately given to the respondents (or a parent or other adult responsible for children) in the field, along with information brochures. The results were explained to respondents by the specially trained health investigators who conducted the tests. All women and men who were eligible for HbA1c, malaria parasites, and Vitamin D3 testing were given a referral card.

| Details of Biomarker Measurements and Tests  |                                                                |                                                                                                                                                            |
|----------------------------------------------|----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Eligible age group                           | Type of Investigation                                          | Instrument Used                                                                                                                                            |
| Children 0-59 months                         | Weight<br>Length/Height                                        | Seca 874 Digital Scale (Weight)<br>Seca 213 Stadiometer (Height)<br>Seca 417 Infantometer (Length) (for children less than 2 years old or less than 85 cm) |
| Children 6-59 months                         | Haemoglobin                                                    | HemoCue Hb 201+ Analyser (Haemoglobin)                                                                                                                     |

| Women and Men age 15 and over                | Blood Glucose<br>Blood Pressure                                | Accu-Chek Performa Glucometer (Blood Glucose)<br>Omron Blood Pressure Monitor (Blood Pressure)                                                             |
| Women and Men age 15 and over<br>(subsample) | HbA1c<br>Vitamin D3<br>Malaria parasites                       | Dried Blood Spot (DBS) on Filter Paper Card                                                                                                                |

**Anthropometry:** Height and weight were measured for children age 0-59 months, women age 15-49, and (in the state module subsample of households only) men age 15-54. The Seca 874 digital scale was used to measure the weight of children and adults. The height of adults and children age 24-59 months was measured with the Seca 213 stadiometer. The Seca 417 infantometer was used to measure the recumbent length of children under two years or less than 85 cm. As per World Health Organization (WHO) guidelines, waist circumference (WC), waist-hip ratio (WHR) and waist-to-height ratio (WHtR) have been found to be appropriate measurements of abdominal obesity. For the first time, NFHS-5 included waist and hip circumference measurements provided by using Gulick tapes for both eligible women and men for measurements of abdominal obesity.

**Anaemia testing:** Blood specimens for anaemia testing were collected by health investigators from eligible women age 15-49, men age 15-54 (in the state module subsample of households), and children age 6-59 months. Consent for the test was taken from eligible women and men. For children age 6-59 months, consent was obtained from a parent or an adult responsible for the child. Blood samples were drawn from a drop of blood taken from a finger prick (or a heel prick for children age 6-11 months) and collected in a microcuvette. Haemoglobin analysis was conducted on-site with a battery-operated portable HemoCue Hb 201+ analyser. Respondents found to have severe anaemia if the haemoglobin level is below 7 grams/decilitre (g/dl) for women, men, and children and if the haemoglobin level is below 9 g/dl for pregnant women were referred to a health facility for further evaluation and treatment.

**Blood glucose testing:** Random blood glucose was measured using a finger-stick blood specimen for all women and men age 15 and above using the *Accu-Chek Performa* glucometer with glucose test strips for blood glucose testing. A referral form to a health facility for additional medical evaluation was provided for any respondent with a random blood glucose level  $\geq 200$  mg/dl. The results of blood glucose display on an LCD digital screen within five second and were given to respondents on a health card immediately after the test was completed. The health investigator

described to the respondent the meaning of the results and advised the respondent if a referral to a medical centre is necessary.

**Blood pressure measurement:** Blood pressure was measured for all women and men age 15 and above using an *Omron Blood Pressure Monitor* to determine the prevalence of hypertension. Blood pressure measurements for each respondent were taken three times with an interval of five minutes between readings. Respondents whose average systolic blood pressure (SBP) was >130 mm Hg and/or whose average diastolic blood pressure (DBP) was >85 mm Hg were considered to have elevated blood pressure readings and they were encouraged to see a doctor for a full evaluation.

#### **Dried Blood Spot (DBS) collection for HbA1c, malaria parasites and drug resistance, and Vitamin D3:**

DBS were collected from a subsample of households on specially designed filter paper cards from eligible respondents for various biomarkers. The various DBS based tests considered under NFHS-5 include:

**Malaria parasites and drug resistance:** Diagnosis of symptomatic and asymptomatic malaria (*Plasmodium* species like *P. falciparum*, *P. vivax*, *P. malariae*, *P. ovale*, and *P. knowlesi*) is important. Also, there is a need to detect markers of antimalarial drug resistance—specific molecular markers in the plasmodium DNA and *hrp2* deletions in the malaria parasites (if present). Most malaria is being reported from states in the eastern, central and north-eastern parts of the country, such as Odisha, Chhattisgarh, Jharkhand, Madhya Pradesh, Tripura, and Meghalaya. To test for malaria, dried blood spots (DBS) were collected. In a random subsample of households, health investigators collected finger-prick blood specimens from eligible women age 15-49 and men age 15-54 who consented to laboratory malaria testing.

**HbA1c Testing:** Glycosylated haemoglobin is a parameter to provide information on the status of diabetes control at the population level among diabetes patients. The testing results also provide useful information on diabetes management strategies and guide policymakers in programme planning. In a random subsample of households, health investigators collected finger-prick blood specimens on a filter paper card from eligible women age 15-49 and men age 15-54 who consented to laboratory HbA1c testing.

**Vitamin D3:** The reported prevalence of Vitamin D3 deficiency is about 50-70% in India. Osteopenia and osteoporosis are common among India adults. Patients with chronic kidney diseases (CKD) may also present with bone disorders before or after developing kidney diseases. They may have osteoporosis and Vitamin D deficiency. Hence, determination of Vitamin D3 levels is of major importance. To test for vitamin D3 deficiency, DBS were collected. In a random subsample of households, health investigators collected finger-prick blood specimens on a filter paper card from eligible women age 15-49 and men age 15-54 who consented to laboratory Vitamin D3 testing.

The results of these tests will be published in a separate report.

## **1.5 PRETEST**

The pretest was conducted during November-December 2017, and training of investigators for the pretest was held at the International Institute for Population Sciences (IIPS), Mumbai. The pretest fieldwork was conducted in five enumeration areas (4 rural, 1 urban) in and around Thane Taluka that had not been selected for the main survey. The pretest was conducted in Hindi speaking areas of Thane district followed by a debriefing session for the field teams. In all, 38 interviewers and 11 health investigators participated in the training. The pretest field practice covered 95 household interviews, 107 woman's interviews, and 59 man's interviews. Biomarkers measurements and testing were conducted on 50 children and 126 adults.

## 1.6 TRAINING OF FIELD STAFF

Training was conducted in a tiered fashion. For each of the two fieldwork phases, a Training of Trainers (ToT) course was conducted by IIPS, Mumbai, and ICF. The ToT for the 19 states and union territories (UTs) included in the first phase was conducted in Goa from 22 April to 12 May, 2019. The ToT for the remaining 17 states and UTs was conducted from October 5-24, 2019 in Chandigarh. The trainees in both ToT workshops included project coordinators, health coordinators, statisticians/demographers, and information technology coordinators from the Field Agencies, and Project Officers/Senior Project Officers from IIPS. The coordinators from Field Agencies were responsible for training fieldworkers at the state/UT level.

## 1.7 FIELDWORK

NFHS-5 fieldwork for India was conducted in two phases (phase one from 17 June 2019 to 30 January 2020 and phase two from 2 January 2020 to 30 April 2021) by 17 Field Agencies. NFHS-5 gathered information from 636,699 households, 724,115 women, and 101,839 men. Data collection was conducted by using 1,061 field teams. Each team consisted of one field supervisor, three female interviewers, one male interviewer, two health investigators, and a driver. The number of interviewing teams in each state varied according to the sample size. In each state, interviewers were hired by the selected Field Agencies, taking into consideration their educational background, experience, and other relevant qualifications. Female and male interviewers were assigned to interview respondents of the same sex. The assignment of Primary Sampling Units (PSUs) to the teams and various logistical decisions were made by the survey coordinators from each Field Agency. Each interviewer was required to make a minimum of three callbacks if no suitable informant was available for the household interview or if an eligible woman or man in the household was not present at the time of the interviewer's visit.

The field supervisor was responsible for the overall management of the field teams. In addition, the field supervisor conducted spot-checks to verify the accuracy of key information, particularly with respect to the eligibility of respondents. IIPS also appointed one or more project officers or senior project officers in each state for monitoring and supervision throughout the training and fieldwork period to ensure that correct survey procedures were followed and that data quality was maintained. Project directors and other senior staff from the Field Agencies, the Principal Investigators from IIPS, officials from MoHFW, and technical consultants from The DHS Program at ICF also visited the field sites to monitor data collection operations.

## 1.8 STRATEGY TO ENSURE DATA QUALITY

Due to the size and complexity of the NFHS-5 survey, considerable thought went into devising strategies to minimize the non-sampling errors and ensure data quality. Some of the procedures adopted are summarized below.

- NFHS-5 was conducted in two phases to make the administration of the training and fieldwork more manageable.
- In the states included in each phase, fieldwork was conducted in a group of five adjacent districts at a time to facilitate close monitoring and supervision of the training of field staff and the implementation of the fieldwork.
- To maintain uniform procedures across the states, several comprehensive manuals were prepared, including a Supervisor's Manual, an Interviewer's Manual, a Health Investigator's Manual, a Household Mapping and Listing Manual, Data Processing Guidelines, and Training Guidelines.
- There were multiple levels of monitoring and supervision of the fieldwork, including monitoring by district coordinators from the Field Agencies; monitoring by senior staff from the state offices of the Field Agencies; positioning two IIPS project officers with each Field Agency for the entire duration of the survey, in addition to monitoring and supervision by senior project officers, project coordinators, IIPS faculty coordinators, staff and consultants from ICF, and representatives from the development partners and the Ministry of Health and

Family Welfare, Government of India. Immediate corrective measures were taken in case there were any deviations from the survey protocols.

- The field supervisor on each interviewing team was required to observe interviews in a subsample of households and to conduct back-checks with respondents as a further check on the quality of the fieldwork.
- Use of computer assisted personal interviewing (CAPI) and the transfer of field data to IIPS on a daily basis were instrumental in remotely monitoring progress of the field teams. Use of CAPI also enabled IIPS and ICF to run extensive data quality checks on the data from the field and to provide real-time feedback to Field Agencies and teams to help improve data quality. A standard set of 44 field-check tables (FCTs) were produced frequently throughout the fieldwork, covering such topics as response rates, age heaping and age displacement, completeness of reporting, sex ratios for children, patterns of height/length and weight measurements, and the contraceptive prevalence rate. (Please refer to the data collection flow chart below).

**Figure 1.1 Data Collection System**

**Figure 1.2 Communication Scenario: Data Collection**

- The CAPI program used in NFHS has an inbuilt feature to select the appropriate language for the interviews from multiple regional languages. Control and management of fieldwork across the country is arranged from the central office by allotment of work to each of more than 500 teams working and accessing their progress on a real-time basis. An inbuilt algorithm in the CAPI program automatically handles skip patterns, filters, and eligibility for questionnaires and sections. The provision of synchronizing data from the interviewer's CAPI instrument to the supervisor's CAPI instrument provides an opportunity for back-checking information to improve data quality. An inbuilt mechanism partially saves incomplete questionnaires to provide opportunities to complete the interview in multiple sessions and minimize respondent's fatigue. Use of SyncCloud Technology improves the data synchronization from the supervisor's CAPI instrument to the Central Office, which gives access to real-time data from any device or computer. The CAPI programs help in generating field-check tables on key indicators on a daily basis which are reviewed by the Quality Assurance Team in the central office to allow individual level feedback to be communicated back to the teams working across different parts of the country.
- NFHS assigns a unique code to each investigator within a state, which helps in tracking the progress and performance of the investigator after individual level feedback is provided.
- Protocols for fieldwork implementation and monitoring are laid down for the smooth execution of the fieldwork. Also, rigorous procedures to check data quality are conducted throughout the course of the fieldwork. These include back-checks of the questionnaires in the field, and the frequent examination of an extensive set of field-check tables to detect systematic errors at the level of the interviewing teams and individual interviewers. Any problems that are detected by the field-check tables can be immediately relayed back to the Field Agencies to be addressed in a timely fashion.
- To ensure uniformity in the implementation of the fieldwork protocols in every state, a centrally-organized Training of Trainers' Workshop of four weeks duration was conducted in each phase. Four persons from each

Field Agency participated in the workshop (two social scientists, one IT specialist, and one health coordinator). These trained persons were responsible for organizing the state-level training programmes in local and regional languages, for a minimum of four weeks' duration, which were supported and supervised by IIPS and ICF.

- To ensure that biomarker tests were conducted properly in a uniform manner, training videos in English and Hindi were produced to indicate the correct procedures for conducting height/length and weight measurements and to demonstrate in detail how to conduct anaemia and blood glucose testing and how to collect blood samples on filter paper cards.
- The protocols used for collection of CAB data have been developed as per international standards which allow comparability with other DHS surveys.
- NFHS-5 used standard, self-calibrating equipment having the latest technologies to ensure minimum instrument errors. The equipment used in the survey is also standardized periodically to ensure the accuracy and consistency of the measurements.
- For the first time in NFHS-5 (2019-21), there was a provision for generating error messages to ensure internal inconsistency in the data with a condition of immediate corrections. IIPS and ICF have developed and implemented this application to reduce the burden of secondary editing after completion of data collection. This application has been designed so that any inconsistencies in the responses of a completed interview will be highlighted. The team supervisor may ask the interviewer about the inconsistencies and make the necessary corrections. The interviewer may revisit the respondent if required for any clarification of those issues. Hence, the error messages turned out to be a handy tool to ensure data quality in NFHS-5 before the survey team left the completed PSU.
- It is worth mentioning that back-checks are an integral part of the quality control mechanism adopted in all the large-scale surveys. However, there are two questions generally raised on the issue of back-checks. First, how households should be selected to revisit. and second, how to incorporate the changes if required. To address these issues, NFHS-5 developed and used an algorithm called the Project Officer's Query Report (POQR) on the Supervisor's CAPI instrument. Once the data collection is completed in a PSU and data are synchronized on the supervisor's CAPI instrument, the IIPS project officer, using a specific login and password, can run the query tool to view a list of households having some potential gaps and inconsistencies in the information. After running POQR, the IIPS PO revisits the household and backchecks the information, maintaining gender sensitivity. Thus, the application of POQR in NFHS-5 has helped in reviewing a subsample of interviewed households to ensure accuracy and reliability of the information, and if there is any problem, to go back to the interviewer's CAPI instrument to correct that information before resynchronizing the data on the supervisor's CAPI instrument.
- NFHS-5 has developed a protocol of accessing real-time data daily using the SyncCloud data streaming system. Continuous evaluation of data through field-check tables and regular feedback to field teams avoids errors and improves the quality of the data. The CAPI programs help in generating field-check tables on key indicators daily, which are reviewed by the Quality Assurance Team (QAT) in the central office to allow individual-level feedback to be communicated to the teams working in different parts of the country. A total of 51 indicators were developed as part of the FCTs covering various aspects of data quality, including response rates, age displacement, birth displacement, and skips associated with multiple questions. These FCTs were used to provide feedback on data quality. Moreover, online interactions with the core team of the Field Agency (FA) and the IIPS field POs once in every two weeks were arranged by the members of the quality assurance unit in

the NFHS-5 office at IIPS. All these innovative measures have made a significant contribution in tracking and monitoring the daily field operations of NFHS-5, particularly to boost the morale of underperforming teams/interviewers and to motivate them by comparing their performance with the performance of other teams.

Taking the COVID-19 situation into account, with the restart of the survey, several protective measures were taken into consideration for survey teams and respondents to prevent COVID-19 infection. Some of these measures were:

- All core team members and survey teams were mandated to install the Aarogya Setu App on their phones and check their COVID status every day before leaving for the field.
- Team members were advised to eat or drink alone with proper social distancing among them and maintaining all the practices for personal hygiene.
- Physical distancing was instructed to maintain during the interview ensuring privacy and confidentiality.
- Teams were educated to check for the well-being of each team member every morning before leaving for fieldwork with thermal screening, which was provided by IIPS. If any team member had developed symptoms, the fieldwork for that team was stopped. It was restarted only if the member was found to be COVID-19 negative.
- Contacting the Headman of the village/frontline workers to get the COVID-19 status of the selected household members before the interviews were done.
- Thermal screening of community people who were willing to be screened by Health Investigators of the survey team on the first day of the visit was carried out while distributing specially designed leaflets to the community members as a part of COVID-19 awareness.
- NFHS made provisions of providing masks, sanitizers, and COVID-19 brochures to all the selected households.
- Each respondent was instructed to give a new mask during the interview and CAB investigations. Compulsory thermal screening was conducted of all the members of the selected households. If anyone had a fever, that household was not allowed to be interviewed. A revisit was done for the reassessment of their status over the next three or four days.
- The team members were obliged to wear a mask during fieldwork. Additional protective equipment like face shields, aprons, and goggles was encouraged. Updated guidelines from the government were adopted from time to time. The team members were directed to use sanitizer/soap and water to clean their hands frequently during fieldwork, preferably at the beginning and end of each interview.
- The CAB investigations were done with minimum contact with the respondents. The protocol of using a new set of gloves for each respondent and disposal of bio-hazardous waste daily was to be strictly adhered to.
- The CAB equipment was mandated to be cleaned after the end of interviews in each household. If the household had any member practicing isolation (very young or old members, and for whom the respondents demand), equipment was cleaned before use for that member.
- The CAPI instrument was mandated to be cleaned after every interview.

## 1.9 DATA PROCESSING

Electronic data collected in the 2019-21 National Family Health Survey were received on a daily basis via the SyncCloud system at the International Institute for Population Sciences, where the data were stored on a password-protected computer. Secondary editing of the data, which required resolution of computer-identified inconsistencies and coding of open-ended questions, was conducted in the field by the Field Agencies and at the Field Agencies central office, and IIPS checked the secondary edits before the dataset was finalized.

Field-check tables were produced by IIPS and the Field Agencies on a regular basis to identify certain types of errors that might have occurred in eliciting information and recording question responses. Information from the field-check tables on the performance of each fieldwork team and individual investigator was promptly shared with the Field Agencies during the fieldwork so that the performance of the teams could be improved, if required.

## 1.10 RESPONSE RATES

Table 1.1 shows response rates for the 2019-21 National Family Health Survey. A total of 664,972 households were selected for the sample, of which 653,144 were occupied. Among the occupied households, 636,699 were successfully interviewed, for a response rate of 98 percent.

In the interviewed households, 747,176 eligible women age 15-49 were identified for individual women's interviews. Interviews were completed with 724,115 women, for a response rate of 97 percent. In all, there were 111,179 eligible men age 15-54 in households selected for the state module. Interviews were completed with 101,839 men, for a response rate of 92 percent.

Table 1.2 shows response rates for each state and union territory. Overall, response rates are quite high. Household response rates were over 95 percent in every state and union territory except Chandigarh (where the household response rate was 88%) and Madhya Pradesh (where the household response rate was 94%). The response rate for women was also 95 percent or higher in every state and union territory except in Chandigarh (where it was 81%). As expected, the response rate for men was lower than the response rate for women in every state and union territory. The response rate for men was particularly low in Chandigarh (63%).

## LIST OF TABLES

For more information on response rate, see the following tables:

|     | Tables                                                                    |
|-----|---------------------------------------------------------------------------|
| 1.1 | Results of the household and individual interviews                        |
| 1.2 | Number of households, women, and men interviewed by state/union territory |

**Table 1.1 Results of the household and individual interviews**

Number of households, number of interviews with women and men, and response rates, according to residence, India, 2019-21

| Result                                    | Residence |         | Total   |
|-------------------------------------------|-----------|---------|---------|
|                                           | Urban     | Rural   |         |
| <b>Household interviews</b>               |           |         |         |
| Households selected                       | 171,709   | 493,256 | 664,972 |
| Households occupied                       | 167,591   | 485,546 | 653,144 |
| Households interviewed                    | 160,138   | 476,561 | 636,699 |
| Household response rate <sup>1</sup>      | 95.6      | 98.1    | 97.5    |
| <b>Interviews with women age 15-49</b>    |           |         |         |
| Number of eligible women                  | 186,921   | 560,255 | 747,176 |
| Number of eligible women interviewed      | 179,535   | 544,580 | 724,115 |
| Eligible women response rate <sup>2</sup> | 96.0      | 97.2    | 96.9    |
| <b>Interviews with men age 15-54</b>      |           |         |         |
| Number of eligible men                    | 29,558    | 81,621  | 111,179 |
| Number of eligible men interviewed        | 26,420    | 75,419  | 101,839 |
| Eligible men response rate <sup>2</sup>   | 89.4      | 92.4    | 91.6    |

Note: Eligible women and men are women age 15-49 and men age 15-54 who stayed in the household the night before the household interview (including both usual residents and visitors). This table is based on the unweighted sample.

<sup>1</sup> Households interviewed/households occupied

<sup>2</sup> Respondents interviewed/eligible respondents

Table 1.2 Number of households, women, and men interviewed by state/union territory

Month and year of fieldwork, number of households, women, and men interviewed, and response rates by state/union territory, India, 2019-21

| State/union territory                | Start month and year of fieldwork |      | End month and year of fieldwork |      | Households interviewed |               | Women interviewed |               | Men interviewed |               |

Note: This table is based on the unweighted sample; all subsequent tables are based on the weighted sample unless otherwise specified. The number of women and men is based on the *de facto* population. The household response rate is defined as the number of households interviewed divided by the number of occupied households. The response rates for women and men are the percentages of eligible women and men with completed interviews.

## Key Findings

- **Drinking water:** Ninety-six percent of households use an improved source of drinking water.
- **Sanitation:** Sixty-nine percent of households use an improved sanitation facility that is not shared with other households and 8 percent use a facility that would be considered improved if it were not shared. Nineteen percent of households have no facility, which means that the household members practice open defecation.
- **Access to sanitation:** Eighty-three percent of households have access to a toilet facility.
- **Electricity:** Ninety-seven percent of households have electricity (95% of rural households and 99% of urban households).
- **Cooking fuel:** Only fifty-nine percent of households use clean fuel for cooking.
- **Age distribution:** Twenty-seven percent of the population is under age 15, and 12 percent is age 60 years and above.
- **Aadhaar card:** Ninety percent of the household population have an Aadhaar card.
- **Bank or post office account:** Ninety-six percent of households have a bank or post office account.
- **Birth registration:** Eighty-nine percent of children under age five had their birth registered.
- **Death registration:** Seventy-one percent of deaths of usual household members were registered with the civil authorities (83% of urban households and 66% of rural households).
- **Orphans:** Among children under age 18, 5 percent are orphans (one or both parents are dead) and 3 percent are not living with a biological parent.
- **Preschool attendance:** Forty percent of boys and girls age 2-4 years attend preschool.
- **School attendance:** The net attendance ratio falls from 83 percent in primary school to 71 percent in middle, secondary, and higher secondary school. The main reason given for not attending school was that the child is not interested in studies (36% for male children and 21% for female children).
- **Disability:** Just 1 percent of the *de jure* household population have any disability. The most prominent type of disability is locomotor (0.4%).
- **Tobacco and alcohol use:** Thirty-eight percent of men and 9 percent of women age 15 and over currently use any tobacco products. Only 1 percent of women and 19 percent of men age 15 and over currently drink alcohol.
- **Household ownership of mosquito net:** More than one-third of households (36%) in India have at least one mosquito net, and 8 percent have at least one Insecticide Treated Mosquito Net (ITN).

Information on the socioeconomic characteristics of the household population in the 2019-21 National Family Health Survey (NFHS-5) provides a context for interpreting demographic and health indicators and an approximate indication of the representativeness of the survey. In addition, this information describes the living conditions of the population.

This chapter presents information on the sources of drinking water, sanitation, exposure to smoke inside the home, household wealth, hand washing, composition of the household population, educational attainment, school attendance, birth registration, children's living arrangements, and parental survivorship, death registration, preschool education, current use of tobacco and alcohol by the adult population, and possession of mosquito nets.

## 2.1 DRINKING WATER SOURCES AND TREATMENT

### Improved sources of drinking water

Include piped water, public taps, standpipes, tube wells, boreholes, protected dug wells and springs, rainwater, tanker truck, cart with small tank, bottled water, and community reverse osmosis (RO) plants.

**Sample:** Households

In India, almost all urban households (99%) and rural households (95%) have access to an improved source of drinking water (**Table 2.1**). Improved sources of water protect against outside contamination so that the water is more likely to be safe to drink.

Urban and rural households rely on different sources of drinking water. The main sources of drinking water for urban households are water piped into their dwelling, yard, or plot (54%), tube wells or boreholes (16%), and public taps or standpipes (12%) (**Table 2.1** and **Figure 2.1**). In contrast, rural households rely most on tube wells or boreholes (46%), followed by water piped into their dwelling, yard, or plot (23%). In rural areas, 68 percent of households have water on their premises or delivered to their dwelling, compared with 86 percent in urban areas. In households where water is not delivered or the source of water is not at the premises, women age 15 years and above are most likely to collect drinking water (71%).

**Figure 2.1 Household Drinking Water by Residence**

*Percent distribution of households by source of drinking water*

Clean water is a basic need for human life. However, 58 percent of households do not treat their water prior to drinking. Treatment is less common in rural areas than urban areas; 66 percent of rural households do not treat their water, compared with 44 percent of urban households. Boiling water and straining the water through a cloth before drinking are the most common water treatment procedures used prior to drinking (16% and 15% of households, respectively).

## 2.2 SANITATION

### Improved toilet facilities

Include any non-shared toilet of the following types: flush/pour flush toilets to piped sewer systems, septic tanks, pit latrines, or an unknown destination; ventilated improved pit (VIP)/biogas latrines; pit latrines with slabs; and twin pit/composting toilets

**Sample:** Households

### Access of sanitation facility

Households that any type of toilet facility that household members usually use and households that do not use a toilet facility but report they have access to a toilet facility.

**Sample:** Households

Sixty-nine percent of Indian households use improved toilet facilities, which are non-shared facilities that prevent people from coming into contact with human waste and can reduce the transmission of cholera, typhoid, and other diseases. Shared toilet facilities of an otherwise acceptable type are also common, especially in urban areas; 11 percent of urban households use a shared facility, compared with 7 percent of rural households (Table 2.2 and Figure 2.2). Nineteen percent of households do not use any toilet facility, meaning that they practice open defecation.

Eighty-three percent of households have access to a toilet facility; a much higher accessibility in urban areas (96%) than in rural areas (76%). Access to a toilet facility ranges from 69 percent among scheduled tribe households to 93 percent among households which are not scheduled caste, scheduled tribe, or other backward class households (Table 2.4). Among the states/UTs, access to a toilet facility is lowest in Bihar (62%), followed by Jharkhand (70%) and Odisha (71%) (Table 2.5).

**Figure 2.2 Household Toilet Facilities by Residence**

Percent distribution of households by type of toilet facilities

**Trends:** The percentage of households practicing open defecation decreased from 39 percent in 2015-16 to 19 percent in 2019-21.

## 2.3 EXPOSURE TO SMOKE INSIDE THE HOME AND OTHER HOUSING CHARACTERISTICS

### 2.3.1 Exposure to Smoke inside the Home

Exposure to smoke inside the home, either from cooking with solid fuels or smoking tobacco, has potentially harmful health effects. Forty-one percent of households in India use some type of solid fuel for cooking, with virtually all being wood or dung cakes (Table 2.6). Exposure to cooking smoke is greater when cooking takes place inside the house rather than in a separate building or outdoors. In 25 percent of households, someone smokes inside the house on daily basis.

### 2.3.2 Other Housing Characteristics

The survey collected data on access to electricity, on flooring materials, and on the number of rooms used for sleeping. Ninety-nine percent of urban households and 95 percent of rural households have electricity. Almost all households in India (97%) have electricity.

Three-fifths of households have *pucca* houses (houses made with high quality materials throughout, including the floor, roof, and exterior walls) and 34 percent have semi-*pucca* houses.

## 2.4 HOUSEHOLD WEALTH

### Wealth index

Households are given scores based on the number and kinds of consumer goods they own, ranging from a television to a bicycle or car, and housing characteristics such as source of drinking water, toilet facilities, and flooring materials. These scores are derived using principal component analysis. National wealth quintiles are compiled by assigning the household score to each usual (*de jure*) household member, ranking each person in the household population by their score, and then dividing the distribution into five equal categories, each with 20 percent of the population.

**Sample:** Households

**Table 2.8** presents wealth quintiles according to urban-rural residence and state. In India, the wealthiest households are concentrated in urban areas. Forty-six percent and 29 percent of the urban population is in the highest and fourth wealth quintile, respectively. By contrast, more than half of the rural population (54%) falls in the two lowest wealth quintiles (**Figure 2.3**). Chandigarh (79%), followed by Delhi (68%) and Punjab (61%), have the highest percentage of the population in the highest wealth quintile. The states with the highest percentages of population in the lowest wealth quintile are Jharkhand (46%), Bihar (43%) and Assam (38%) (**Table 2.8**). Seventy-one percent of the population in scheduled tribe households and 49 percent of the population in scheduled caste households are in the two lowest wealth quintiles (**Table 2.9**).

**Figure 2.3 Household Wealth by Residence**

*Percent distribution of de jure population by wealth quintiles*

The survey also collected information on household assets, means of transportation, agricultural land, and farm animals (**Table 2.11** and **Table 2.12**). The percentage of households that have a bank account or a post office account is almost the same in urban (95%) and rural areas (96%). Urban households are somewhat more likely than rural households to have a mobile telephone (97% versus 92%). Rural households are more likely than urban households to own agricultural land (52% versus 13%) or farm animals (58% versus 10%).

## 2.5 HAND WASHING

To obtain hand washing information, interviewers were asked to see the place where the *de jure* population most often wash their hands. A place for washing hands was observed for 96 percent of the *de jure* population. Soap was available at the place of hand washing for 75 percent of households and water was available for 92 percent of households, while 16 percent had material such as ash, mud or sand other than the soap and water only (**Table 2.13**). Twenty-six percent of the population did not have water, soap, or another cleansing agent for hand washing on the premises.

## 2.6 HOUSEHOLD POPULATION AND COMPOSITION

### Household

A person or group of related or unrelated persons who live together in the same dwelling unit(s), who acknowledge one adult male or female as the head of the household, who share the same housekeeping arrangements, and who are considered a single unit.

### De facto population

All persons who stayed in the selected households the night before the interview (whether usual residents or visitors).

### De jure population

All persons who are usual residents of the selected households, whether or not they stayed in the household the night before the interview.

### How data are calculated

All tables are based on the *de facto* population, unless specified otherwise.

A total of 2,768,371 individuals stayed overnight in the 636,699 sample households in the NFHS-5 survey. The population pyramid in **Figure 2.4** illustrates the distribution by five-year age groups and sex. The pyramid shows that India's population is young, which is typical of developing countries with low life expectancy. The pyramid also shows that fertility has decreased considerably in the last 5 years. Children under age 15 represent 27 percent of the household population, while individuals age 60 and older represent only 12 percent of the household population (**Table 2.15**).

**Table 2.14** shows that 18 percent of households have female heads. Urban households are somewhat smaller, on average, than rural households (4.2 and 4.5 persons, respectively). Overall, 13 percent of households have one or more foster or orphan children under age 18.

**Figure 2.4 Population Pyramid**

Percent distribution of the *de facto* household population

**Trends:** The percentage of children under age 15 declined from 29 percent in NFHS-4 (2015-16) to 27 percent in NFHS-5 (2019-21). In contrast, the population 60 years and older increased slightly, from 10 percent in NFHS-4 to 12 percent in

NFHS-5. The average household size decreased slightly between 2015-16 and 2019-21 (from 4.6 to 4.4 persons), and the percentage of female-headed households increased slightly, from 15 percent in NFHS-4 to 18 percent in NFHS-5.

## 2.7 BIRTH REGISTRATION

### Registered birth

Child has a birth certificate or child does not have a birth certificate, but his/her birth is registered with the civil authorities.

**Sample:** *De jure* children under age five years

**Table 2.16** presents information on birth registration of children under age five years. At the time of the survey, 89 percent of children under age five years had their births registered with the civil authority; this includes 75 percent of children with birth certificates. Female and male children are equally likely to have their birth registered. Children in urban areas (93%) are more likely than children in rural areas (88%) to have their births registered. Birth registration is universal in Lakshadweep and Goa, is 95 percent or more in 21 States/UTs, and is below 80 percent in Bihar (76%), Jharkhand (74%), and Nagaland (73%). (**Table 2.17** and **Figure 2.5**).

**Figure 2.5 Birth Registration by State/UT**

*Percentage of de jure children under age five whose births are registered with the civil authorities*

**Trends:** Birth registration among children under age five years increased between NFHS-4 and NFHS-5 (from 80% to 89%). The percentage of births that were registered increased by more than 60 percentage points between 2015-16 and 2019-21 in Jharkhand, Bihar, Uttar Pradesh, and Nagaland.

## 2.8 DEATH REGISTRATION

### Registered death

Deaths of usual household members occurred during the 3 years preceding the survey and are registered with the civil authority.

**Sample:** *De jure* household population

**Table 2.18** presents information on death registration of usual household members in the three years preceding the survey with the civil authorities. Seventy-one percent of deaths of usual household members were registered with the civil authorities (51 percent of deaths at age 0-4, 76 percent of deaths at age 25-34, and 75 percent of deaths at age 35 and above). Death registration is higher in urban (83%) than rural areas (66%) and among males (75%) than females (66%). Death registration increases with wealth; the highest registration is in the highest wealth quintile (87%) and the lowest is in lowest wealth quintile (52%). Among the states/UTs, death registration is lowest in Bihar (36%), followed by Arunachal Pradesh (37%) and Nagaland (39%) (**Table 2.19**).

## 2.9 CHILDREN'S LIVING ARRANGEMENTS AND PARENTAL SURVIVAL

### Orphan

A child with one or both parents who are dead.

**Sample:** *De jure* children under age 18 years

Only 3 percent of children under age 18 years are not living with a biological parent (**Table 2.20**). Five percent of children under age 18 years are orphans with one or both parents who have died. The percentage of children who are orphans rises rapidly with age, from less than 1 percent among children under age 2 to 9 percent among children age 15-17 (**Figure 2.6**). The Northeast region has the highest percentage of children who are orphans (6% or more in every state except Tripura) (**Table 2.21**).

**Trends:** The percentage of children under age 18 who do not live with a biological parent has not changed between NFHS-4 and NFHS-5 (3%). The percentage of children under age 18 who are orphans (5%) did not change between 2015-16 and 2019-21.

**Figure 2.6 Orphanhood by Child's Age**

Percentage of *de jure* children under age 18 with one or both parents dead

## 2.10 SCHOOLING

### 2.10.1 Educational Attainment

#### Median educational attainment

Half the population has completed less than the median number of years of schooling and half the population has completed more than the median number of years of schooling.

**Sample:** *De facto* household population age six and over

Overall, 72 percent of females and 87 percent of males age six and over have ever attended school. Nearly one-third of females (31%) have 7 or less years of schooling; 14 percent completed 8-9 years of schooling. Among males, 34 percent have less than 7 years of schooling; 16 percent completed 8-9 years of schooling. Only 10 percent of females and 13 percent of males completed 10-11 years of schooling. Twenty-eight percent of females and 14 percent of males have never attended school. Seventeen percent of females and 23 percent of males completed 12 or more years of schooling. The median number of years of schooling completed is higher for males (7.3 years) than for females (4.9 years) (**Table 2.24**).

**Trends:** Educational attainment at the household level increased between 2015-16 and 2019-21. Among females, the median number of years of schooling increased from 4.4 years in NHFS-4 (2015-16) to 4.9 years in NHFS-5 (2019-21). The median number of years of schooling completed by males increased from 6.9 years in NHFS-4 to 7.3 years in NHFS-5. Over the same period, the percentage of females and males with no schooling decreased from 31 percent of females and 15 percent of males to 28 percent of females and 14 percent of males.

### Patterns by background characteristics

- Among both females and males, the median number of years of schooling is higher in urban areas than in rural areas (7.5 years versus 4.0 years among females and 8.8 years versus 6.5 years among males).
- Educational attainment increases with household wealth. Females in the lowest wealth quintile have completed a median of 0.4 years of schooling, compared with a median of 9.3 years for females in the highest wealth quintile. The median number of years of schooling was 3.7 years among males in the lowest wealth quintile and 10.0 years among those in the highest quintile.
- The median number of years of schooling is highest among those who do not belong to scheduled castes, scheduled tribes, and other backward classes (7.0 years for females and 8.5 years for males). The median number of years of schooling is lower among Muslims than for other specific religious groups (4.3 years for females and 5.4 years for males).
- The percentage of the household population with no schooling is higher in rural areas than urban areas (33% versus 17% for females and 16% versus 8% for males).

## 2.10.2 Preschool attendance

### Preschool attendance

Children age 2 to 4 years attending pre-primary education, such as at an *anganwadi* centre (Integrated Child Development Service), improves school readiness by providing quality learning through interactive play methods with qualified instructors.

**Sample:** *De facto* household population age 2 to 4 years

Attending pre-primary education, such as at an *anganwadi* centre, improves children's school readiness. Also, parents or guardians can go to work at ease if children are enrolled in pre-primary education.

Forty percent of both boys and girls age 2-4 years attend preschool. There is no difference in preschool attendance among children in nuclear households and non-nuclear households (40% each). Preschool attendance is the lowest among children in households with household head belonging to other religions (33%) and Muslim religion (34%). Preschool attendance is lower among children belonging to scheduled caste and other backward classes (38% each), compared with children from any other caste/tribe group. Preschool attendance is higher in households with 3 to 5 members (43%) than in households with 1-2 members (39%) and household with 6 or more members (38%). Overall, rural households (39%) show lower preschool attendance than urban households (44%) (**Table 2.22**). Preschool attendance is highest in Andaman and Nicobar Islands (89%), followed by Andhra Pradesh (75%) and Sikkim (74%) (**Table 2.23**).

### 2.10.3 School Attendance

#### Net attendance ratio (NAR)

Percentage of the school-age population that attends primary or secondary school.

**Sample:** Children age 6-10 for primary school NAR and children age 11-17 for secondary school NAR

#### Gross attendance ratio (GAR)

The total number of children attending primary school divided by the official primary school age population and the total number of children attending secondary school divided by the official secondary school age population.

**Sample:** Children at the official primary school age for primary school GAR and children at the official secondary school age for secondary school GAR

Eighty-seven percent of children age 6-17 attend school (88% of males and 87% of females) (**Table 2.26**). Almost all (95%) males and females age 6-10 attend school. This percentage decreases to 91 percent for children age 11-14 and then drops further to 70 percent for children age 15-17. There is almost no difference in school attendance by males (94%) and females (93%) at age 6-14, but males are more likely than females to attend school at age 15-17 (72% versus 68%). Urban-rural differentials in school attendance are minimal at age 6-10, but widen at older ages (**Figure 2.7**).

Eighty-three percent of girls and 84 percent of boys age 6-10 attend primary school (**Table 2.27**). The net attendance ratio (NAR) drops in secondary school: only 70 percent of girls and 72 percent of boys age 11-17 attend secondary school.

The gross attendance ratio (GAR) is 92 percent at the primary school level and 82 percent at the secondary school level. These figures indicate that a number of children outside the official school age population for that level are attending primary school, and not all those who should be are attending secondary school (**Table 2.27**).

**Figure 2.7 School Attendance by Age, Sex, and Residence**

*Percentage of children age 6-17 years attending school*

### Gender parity index (GPI)

The ratio of female to male children attending primary school and the ratio of female to male children attending secondary school. The index reflects the magnitude of the gender gap.

**Sample:** Children attending primary school and children attending secondary school

A gender parity index (GPI) of 1 indicates parity or equality between the school participation ratios for males and females. A GPI lower than 1 indicates a gender disparity in favour of males, with a higher proportion of males than females attending that level of schooling. A GPI higher than 1 indicates a gender disparity in favour of females.

The GPI for the NAR is 0.99 at the primary school level and 0.97 at the secondary school level. This indicates that there is relatively little difference in overall school attendance by school-age girls and boys at either the primary or secondary school level. The GPI for the GAR is also slightly less than 1, which indicates that male children outside of the official school age population are only slightly more likely to attend school than their female counterparts; the GPIs for the GAR are almost the same at the primary school level (0.98) and at the secondary school level (0.97).

### Patterns by background characteristics

- At the primary school level, there is no difference in the NAR between urban and rural areas (83% each). However, at the secondary school level, the NAR is higher in urban areas than in rural areas (76% versus 70%).
- The NARs increase with household wealth at the secondary school level. Attendance in the lowest wealth quintile is 57 percent for girls and 59 percent for boys, compared with 83 percent for girls and 84 percent for boys in the highest wealth quintile.
- At the primary school level, there is a slight difference in the GAR between urban and rural areas (90% and 92%, respectively). However, at the secondary school level, the GAR is higher in urban areas than in rural areas (87% versus 80%).
- The GARs increase with household wealth at the secondary school level. Attendance in the lowest wealth quintile is 66 percent for girls and 68 percent for boys, compared with 95 percent for girls and 96 percent for boys in the highest wealth quintile.
- There is not much difference by caste/tribe in the NAR and GAR at of the primary school level, but at the secondary school level, children belonging to scheduled tribes have the lowest NARs and GARs.

## 2.11 DISABILITY

### Disability

All usual household members who have any disability in specified domains such as hearing, speech, visual, mental, locomotor, and others.

**Sample:** 1) All *de jure* household population.

2) *De jure* household population age 15 years and over having any form of disability.

The respondent to the Household Questionnaire provided information for all usual household members on whether or not they have any disability in specified domains. The domains of disability are hearing, speech, visual, mental, locomotor, and others. Just 1 percent of the *de jure* household population has any disability. The most prominent type of disability is locomotor (0.4%). Men are slightly more likely than women to have any disability (1.2% of men compared with 0.8% of

women). The proportion of household members who have any disability rises with increasing age. For instance, 1.2 percent of the household members age 50 and above were reported to have any disability, compared with 0.3 percent of the youngest age group (**Table 2.29**).

Men are slightly more likely than women to have any disability at age 15 years and above (1.4% of men compared with 0.9% of women). The rural population (1.2%) is slightly more likely to have any type of disability than the urban population (0.9%) (**Table 2.30**). Any type of disability is highest in Lakshadweep (1.9%), followed by Tamil Nadu (1.5%) (**Table 2.31**).

## 2.12 USE OF TOBACCO AND ALCOHOL

### Tobacco

Household population age 15 years and over who currently use any form of tobacco, such as *cigar*, pipe, *hookah*, *gutkha* / *paan masala* with tobacco, *khaini*, *paan* with tobacco, other chewing tobacco and snuff.

**Sample:** *De facto* household population age 15 years and over.

### Alcohol

Household population age 15 years and over who currently drink any form of alcohol.

**Sample:** *De facto* household population age 15 years and over.

Thirty-eight percent of men and 9 percent of women age 15 and over currently use any tobacco products. Among men as well as women, the use of tobacco is higher in rural areas (43% for men and 11% for women) than in urban areas (29% for men and 6% for women). Nearly three-fifths of men (58%) and 15 percent of women with no schooling or less than 5 years of schooling use tobacco. Tobacco use shows a steady and substantial decrease with increasing levels of education among both men and women. However, eighteen percent of men with 12 or more years of schooling use tobacco. There is an equally clear and continual decrease in tobacco use with increasing wealth quintiles. Over one-fifth of men (21%) in the highest wealth quintile use tobacco, in comparison with 58 percent of men in the lowest wealth quintile. Seventeen percent of women in the lowest wealth quintile use tobacco. Women (19%) and men (51%) belonging to scheduled tribes are more likely to use tobacco than those from any other caste/tribe groups (**Table 2.35**). Tobacco use among men age 15 and over is highest in Mizoram (73%), followed by Andaman & Nicobar Islands (59%) and Manipur (58%). Tobacco use among women is highest in Mizoram (62%), Tripura (51%), and Manipur (43%) (**Table 2.36**).

Only 1 percent of women drink alcohol, compared with 19 percent of men. Drinking alcohol is more common among women from scheduled tribes (6%) than from any other caste/tribe groups. Among men, alcohol use is higher among those belonging to other religions (47%), those with no schooling (30%), scheduled tribes (33%), and those age 35-49 (27%) (**Table 2.33**). Alcohol use among women age 15 and over is highest in Arunachal Pradesh (24%) and Sikkim (16%). Alcohol use among men is highest in Arunachal Pradesh (53%) and Telangana (43%), and is the lowest in Lakshadweep (0.4%) (**Table 2.34**).

**Map 2.1: Men age 15 years and above who use any kind of tobacco, NFHS-5, 2019-21**

The percentage of men age 15 years and above who use any kind of tobacco exceeds 40 percent in most parts of Madhya Pradesh, Uttar Pradesh, Odisha, Jharkhand, West Bengal, Bihar, Chhattisgarh, Northeastern states, northern part of Maharashtra, western Gujarat, and southern Rajasthan. Use of tobacco is also high (30–40%) in Ladakh, Uttarakhand, most parts of Maharashtra, Karnataka, northern parts of Rajasthan, and northwestern Gujarat. Lower prevalence of tobacco use (below 30 percent) is mostly observed in Punjab and southern states, except in central parts of Karnataka (**Map 2.1**).

**Map 2.2: Men age 15 years and above who consume alcohol, NFHS-5, 2019-21**

A higher proportion (40% and above) of alcohol consumption among men age 15 years and over is found in Telangana, Arunachal Pradesh, upper Brahmaputra region of Assam, a few districts in Jharkhand and Bastar region of Chhattisgarh, and the Chhota Nagpur region of Jharkhand and Odisha. A 30-40 percent level of alcohol consumption is found in the districts of Chhattisgarh, Uttarakhand, Manipur, Meghalaya, Tripura, and a few districts of Odisha. A lower level (below 30%) of alcohol consumption is observed in the remaining parts of the states in India (**Map 2.2**).

## 2.13 POSSESSION OF MOSQUITO NETS

### Ownership of insecticide-treated nets

Households that have at least one insecticide-treated net (ITN). An ITN is defined as a factory-treated net that does not require any further treatment.

**Sample:** Households

### Full household ITN coverage

Percentage of households with at least one ITN for every two people.

**Sample:** Households

An important strategy in the control of malaria and kala-azar is prevention through use of mosquito nets to protect themselves from mosquito bites.

More than one-third of households (36%) in India have at least one mosquito net, while 8 percent have at least one Insecticide Treated Mosquito Net (ITN). On average, there are 0.2 ITNs per household. Four percent of households have achieved full household ITN coverage, meaning a household has at least one ITN for every two persons who slept in the household the night before the survey. Twenty percent of households had at least one mosquito net of any type for every two persons who slept in the household last night. The proportion of households having at least one ITN for every two persons who slept in the household last night is highest in Nagaland (43%), Arunachal Pradesh (35%), and Mizoram (26%) (Table 2.32).

### Patterns by background characteristics

- Seven percent of households in the lowest wealth quintile have full household ITN coverage, compared with two percent of households in the highest wealth quintile.
- Urban households are less likely (2%) than rural households (5%) to have full household ITN coverage.

## LIST OF TABLES

For more information on the household population and housing characteristics, see the following tables:

| Tables     |                                                                                       |
|------------|---------------------------------------------------------------------------------------|
| Table 2.1  | Household drinking water                                                              |
| Table 2.2  | Household sanitation facilities                                                       |
| Table 2.3  | Sanitation facility type by wealth quintile and state/union territory                 |
| Table 2.4  | Access to a toilet facility                                                           |
| Table 2.5  | Access to a toilet facility by state/union territory                                  |
| Table 2.6  | Housing characteristics                                                               |
| Table 2.7  | Housing characteristics by state/union territory                                      |

BPL = Below poverty line

<sup>1</sup> Percentage of households in which any usual member of the household has a bank account/post office account

<sup>2</sup> Percentage of households in which any usual member of the household is covered by a health insurance/financing scheme

Table 2.12 Household ownership of agricultural land, house, and farm animals

Percent distribution of urban, rural, and total households and *de jure* population owning agricultural land by type of land and percentage owning a house and farm animals, India, 2019-21

| Asset                                       | Urban   | Rural   | Total   | <i>De jure</i><br>population |
|---------------------------------------------|---------|---------|---------|------------------------------|
| No agricultural land                        | 86.9    | 47.8    | 60.8    | 57.7                         |
| Irrigated land only                         | 1.1     | 1.3     | 1.2     | 1.3                          |
| Non-irrigated land only                     | 3.1     | 11.9    | 9.0     | 9.1                          |
| Both irrigated and non-irrigated land       | 8.8     | 39.0    | 29.0    | 31.9                         |
| Total                                       | 100.0   | 100.0   | 100.0   | 100.0                        |
| Percentage owning a house                   | 65.3    | 76.4    | 72.7    | 74.5                         |
| Percentage owning farm animals <sup>1</sup> | 10.3    | 57.8    | 42.0    | 47.4                         |
| Number                                      | 211,271 | 425,428 | 636,699 | 2,780,724                    |

<sup>1</sup> Cows, bulls, buffaloes, camels, horses, donkeys, mules, goats, sheep, chickens, or ducks

Table 2.13 Handwashing

Percentage of the *de jure* population for whom the place most often used for washing hands was observed, and total percentage of the *de jure* population for whom the place for handwashing was observed; and among the *de jure* population for whom the place for handwashing was observed, percentage with water available, percentage with soap available, and percentage with a cleansing agent other than soap available; percentage of the *de jure* population with a basic handwashing facility and percentage with a limited handwashing facility, according to background characteristics, India, 2019-21

| Background characteristic | Percentage of <i>de jure</i> population for whom place for washing hands was observed: | Number of persons | Place for handwashing observed and: |                             |                                                        | Number of persons for whom place for handwashing was observed | Percentage of the <i>de jure</i> population with a basic handwashing facility <sup>3</sup> | Percentage of the <i>de jure</i> population with a limited handwashing facility <sup>4</sup> | Number of persons for whom a place for handwashing was observed or with no place for handwashing in the dwelling, yard, or plot |

Note: Table is based on *de jure* members, i.e., usual residents.

<sup>1</sup> Nuclear household are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals.

<sup>2</sup> Double orphans are children both of whose parents are dead. Single orphans are children with one dead parent and an unknown survival status of the other parent

<sup>3</sup> Foster children are those under age 18 living in households with neither their mother nor their father present, and the mother and/or the father are alive.

Table 2.15 Household population by age, residence, sex, and possession of an *Aadhaar* card

Percent distribution of the *de facto* household population by age and percentage of individuals who have an *Aadhaar* card, according to residence and sex, India, 2019-21

<sup>1</sup> Includes children with father dead, mother dead, both parents dead, and one parent dead but missing information on survival status of the other parent

Table 2.21 Children's living arrangements and orphanhood by state/union territory

Percent distribution of *de jure* children under age 18 by children's living arrangements and survival status of parents, percentage of children not living with a biological parent, and percentage of children with one or both parents dead, according to state/union territory, India, 2019-21

| State/union territory | Living with both parents | Living with mother but not with father |             | Living with father but not with mother |             | Not living with either parent |                   |                   |           | Total | Percentage not living with a biological parent | Percentage with one or both parents dead <sup>1</sup> |

Note: In this table, children's age refers to their age at the start of the 2019-20 (assumed here to be April 2019).

<sup>1</sup> The NAR for primary school (standards 1-5) is the percentage of the primary-school age population (6-10 years) that is attending primary school. The NAR for middle, secondary, and higher secondary school (standards 6-12) is the percentage of the population in the appropriate age group for those school levels (11-17 years) that is attending those school levels. By definition, the NAR cannot exceed 100.0 percent.

<sup>2</sup> The GPI for primary school is the ratio of the primary school NAR (GAR) for females to the NAR (GAR) for males. The gender parity index for middle, secondary, and higher secondary school is the ratio of the NAR (GAR) for females to the NAR (GAR) for males at those levels of school.

<sup>3</sup> The GAR for primary school (standards 1-5) is the total number of primary school students, expressed as a percentage of the official primary-school-age population (6-10 years). The GAR for middle, secondary, and higher secondary school (standards 6-12) is the total number of students in those school levels, expressed as a percentage of the official population that is the appropriate age to be attending those school levels. If there are significant numbers of overage and underage students at a given level of schooling, the GAR can exceed 100.0.

Table 2.28 Reasons for children currently not attending school

Percent distribution of *de facto* children age 6-17 years who dropped out of school before the 2019-20 school year by the main reason for not attending school in that school year, according to residence and sex, India, 2019-21

| Main reason                                           | Urban |        | Rural  |        | Total  |        |
|-------------------------------------------------------|-------|--------|--------|--------|--------|--------|
|                                                       | Male  | Female | Male   | Female | Male   | Female |
| School too far away                                   | 1.5   | 2.8    | 2.6    | 7.0    | 2.3    | 6.2    |
| Transport not available                               | 0.7   | 1.0    | 0.8    | 1.7    | 0.7    | 1.5    |
| Further education not considered necessary            | 3.2   | 5.4    | 3.9    | 3.4    | 3.7    | 3.8    |
| Required for household work                           | 9.5   | 13.9   | 9.9    | 13.2   | 9.8    | 13.3   |

Note: Table is based on the responses of the respondent to the household questionnaire.

nc = No cases

Table 2.32 Household possession of mosquito nets

Percentage of households with at least one mosquito net (treated or untreated) and insecticide-treated net (ITN); average number of nets and ITNs per household; and percentage of households with at least one net and ITN per two persons who stayed in the household last night, according to background characteristics, India, 2019-21

| Background characteristic | Percentage of households with<br>at least one mosquito net |                    | Average number of nets<br>per household |                    | Percentage of households with<br>at least one net for every two<br>persons who stayed in the<br>household last night |                    |

## CHARACTERISTICS OF RESPONDENTS

### Key Findings

- **Literacy:** Seventy-two percent of women and 84 percent of men are literate.
- **Schooling:** Forty-one percent of women and 50 percent of men have 10 or more years of schooling.
- **Exposure to mass media:** Forty-one percent of women and 32 percent of men are not regularly exposed to mass media (newspapers, magazines, television, radio, or cinema).
- **Employment:** Men are more likely to be employed than women; 25 percent of women are currently employed, compared with 75 percent of men. Eighty-three percent of employed women earn cash for their work.
- **Occupation:** Forty-six percent of women and 32 percent of men who were employed in the 12 months preceding the survey are engaged as agricultural workers, whereas only 11 percent of women and 9 percent of men work in the service sector.
- **Internet usage:** One-third of women and slightly over half (51%) of men age 15-49 have ever used the internet.

This chapter presents information on the demographic and socioeconomic characteristics of the survey respondents, such as age, schooling, place of residence, marital status, employment, and wealth status. This information is useful for understanding the factors that affect use of reproductive health services, contraceptive use, and other health behaviours.

### 3.1 BASIC CHARACTERISTICS OF SURVEY RESPONDENTS

A total of 724,115 women age 15-49 and 101,839 men age 15-54 were interviewed in the 2019-21 National Family Health Survey. Thirty-three percent each of women and men are in the 15-24 age group, while 30 percent of women and 29 percent of men are in the 25-34 age group (**Table 3.1**).

Among respondents age 15-49, women are more likely than men to be currently married (72% and 60%, respectively).

The distribution of respondents by religion shows that a large majority are Hindus (81% of women and 79% of men), while 14 percent of women and 16 percent of men are Muslims, 2 percent of women and 3 percent of men are Christians, 2 percent of women and 1 percent of men are Sikhs, and 1 percent each are Buddhists/Neo-Buddhists.

Forty-three percent of women and 42 percent of men belong to other backward classes (OBC), while 22 percent of women and 20 percent of men belong to a scheduled caste, 9 percent each of women and men belong to a scheduled tribe, and 25 percent of women and 28 percent of men do not belong to a scheduled caste, a scheduled tribe, or an other backward class.

Nineteen percent of women and 17 percent of men are from households in the lowest wealth quintile, while 20 percent each of women and men are in households in the highest wealth quintile.

3.2 SCHOOLING AND LITERACY

Literacy

Respondents who have completed standard nine or higher are assumed to be literate. All other respondents were given a sentence to read, and they were considered to be literate if they could read all or part of the sentence.  
**Sample:** Women and men age 15-49

Twenty-three percent of women and 11 percent of men have no schooling, and women (26%) are less likely than men (32%) to have completed 12 or more years of schooling (Table 3.2.1, Table 3.2.2, and Figure 3.1). Eighty-four percent of men and 72 percent of women are literate (Table 3.3.1 and Table 3.3.2).

**Trends:** Since 2015-16, there has been a substantial increase in the percentage of women and men age 15-49 attending school and completing higher levels of education. During the same period, the gap between women and men has narrowed. The percentage of women with no schooling has decreased by 5 percentage points and the percentage of men with no schooling has decreased by 2 percentage points. The percentage of women and men completing 12 or more years of schooling has increased by 4 percentage points and 3 percentage points, respectively.

Figure 3.1 Education of Survey Respondents  
Percent distribution of women and men age 15-49

Patterns by background characteristics

- Younger respondents are more likely to have attended school and to have reached higher levels of education than older respondents. Only 4 percent of women age 15-19 and 9 percent of women age 20-24 have no schooling, while almost half of women age 45-49 (48%) and 41 percent of women age 40-44 have no schooling (Table 3.2.1).
- Urban women are more educated than their rural counterparts. More than one-fourth (27%) of rural women have never attended school, compared with 13 percent of urban women. Twenty percent of women in rural areas have completed 12 or more years of schooling, compared with 39 percent in urban areas (Table 3.2.1 and Figure 3.2).

Figure 3.2 Secondary or Higher Education by Residence  
Percentage of women and men age 15-49

- The percentage of women and men who have completed secondary school or higher increases by wealth quintile; 6 percent of women and 10 percent of men in the lowest wealth quintile completed 12 or more years of schooling, compared with more than half of women (55%) and men (62%) in the highest wealth quintile.
- Literacy in each group is lowest among men and women in rural areas; those age 40-49; those who are widowed, divorced, separated, or deserted; those in the lowest wealth quintile; and those belonging to a scheduled tribe (**Table 3.3.1** and **Table 3.3.2**).
- Bihar and Kerala represent two contrasting profiles of literacy. Bihar has the lowest literacy of 55 percent among women and 76 percent of men, while literacy is almost universal among women and men in Kerala (**Table 3.4.1** and **Table 3.4.2**).

### 3.3 MASS MEDIA EXPOSURE

#### Exposure to mass media

Respondents were asked how often they read a newspaper or magazine, listened to the radio, watched television, or went to the cinema. Those who responded at least once a week (or at least once a month for the cinema) are considered to be regularly exposed to that form of media.

**Sample:** Women and men age 15-49

Information on the exposure of women and men to mass media is especially important for the development of educational programmes, particularly information about family planning, HIV/AIDS, and other important health topics. Men are more likely than women to be exposed to any and all forms of media, including newspapers, television, radio, and the cinema (**Figure 3.3**). Television is the most common form of media exposure for both women and men across all subgroups, followed by newspapers or magazines. A substantial proportion of women and men do not access any of the four media at least on a weekly basis (41% of women and 32% of men) (**Table 3.5.1** and **Table 3.5.2**).

**Figure 3.3 Exposure to Mass Media**

*Percentage of women and men age 15-49*

**Trends:** Exposure to each of the four types of mass media decreased for both women and men between 2015-16 and 2019-21, except for visits to the cinema/theatre at least once a month which increased slightly. The percentage of women who did not access any of the media types at least once a week increased from 25 percent in 2015-16 to 41 percent in 2019-21. Fourteen percent of men did not access any of the media types at least once a week in 2015-16, compared with 32 percent in 2019-21.

#### Patterns by background characteristics

- Rural women are more likely to have no regular exposure to any form of mass media than their urban counterpart (50% versus 23%). The same pattern holds true for men (39% versus 18%) (**Table 3.5.1** and **Table 3.5.2**).
- Only 21 percent of women and 15 percent of men with 12 or more years of schooling lack regular exposure to any mass media, compared with 67 percent of women and 61 percent of men with no schooling.

- Thirty-three percent of women and over half (51%) of men age 15-49 in India have ever used the internet. More than half (52%) of women and 66 percent of men in urban areas have ever used the internet, compared with only one-fourth of women and 43 percent of men in rural areas (**Figure 3.4**).
- Ever use of the internet increases with education with 72 percent of women and three-quarters of men with 12 or more years of education ever using the internet, compared with 8 percent of women and less than one-quarter (24%) of men with less than five years of schooling.
- Never married women and men are more likely to have ever used the internet (50% and 57%, respectively) than those in other marital status groups. More women and men in the highest wealth quintile have ever used the internet (69% and 78%, respectively) than those in the lowest wealth quintile (9% and 26%, respectively) (**Table 3.6**).

**Figure 3.4 Internet Usage by Residence**

Percentage of women and men age 15-49

### 3.4 EMPLOYMENT

#### Currently employed

Respondents who were employed in the seven days before the survey. Includes respondents who did not work in the past seven days but who are regularly employed and were absent from work for leave, illness, vacation, or any other such reasons.

**Sample:** Women and men age 15-49

**Figure 3.5 Employment Status by Schooling**

Percentage of women and men age 15-49 who are currently employed

Men are three times as likely to be currently employed as women; 25 percent of women age 15-49 are currently employed, compared with 75 percent of men age 15-49 (**Table 3.8** and **Table 3.9**). Seventy percent of women and 19 percent of men reported that they were not employed in the 12 months preceding the survey. A lower percentage of women than men are currently employed in every state (**Table 3.10**). The employment level is much higher among less educated persons, highest among persons with less than 5 years of schooling (89% among men and 34% among women), and those with no schooling at all (87% among men and 34% among women) (**Figure 3.5**).

**Trends:** Since 2015-16, current employment levels have marginally increased for women. Twenty-four percent of women were currently employed in 2015-16, compared with 25 percent in 2019-21. Among men, the proportion who are currently employed has not changed in the same period.

### Patterns by background characteristics

- Women and men with 10-11 years of schooling, never married women and men, women and men with no children, and women and men belonging to the highest wealth quintile are less likely to be employed than others.
- Bihar (14%), Uttar Pradesh (17%), and Assam (18%) have the lowest percentage of women currently employed. More than one-third of women were currently employed in Karnataka (35%), Andhra Pradesh (37%), Telangana (39%), Manipur (40%), and Meghalaya (42%) (**Table 3.10**).

## 3.5 OCCUPATION

### Occupation

Categorized as professional/technical/administrative/managerial, clerical, sales and services, skilled manual, unskilled manual, agriculture

**Sample:** Women and men age 15-49 who were currently employed or had worked in the 12 months before the survey

Women are most commonly employed as agricultural workers (46%), followed by production workers (21%), and men are most commonly employed as agricultural workers and production workers (32% each) (**Tables 3.11**). A higher proportion of employed women (10%) than employed men (7%) are engaged in professional, technical, administrative, or managerial occupations.

A large majority of women who worked in the past year and did agricultural work are employed by family members (84%) and earn cash for their work (73%). Ninety-two percent of women who did non-agricultural work earned cash for their work. Among women who worked in the last one year, 11 percent were self-employed (**Table 3.12**).

### Patterns by background characteristics

- Urban women are most likely to be employed as production workers (28%) and professional workers (22%), while urban men are most likely to be employed as production workers (38%) and sales workers (18%). In rural areas, however, women are most likely to be agricultural workers (61%) and men are most likely to be service workers (29%).
- A large majority of employed women (83%) and men (94%) earned in cash for their work, but 14 percent of women and 4 percent of men did not receive any payment.

## LIST OF TABLES

## FERTILITY AND FERTILITY PREFERENCES

### Key Findings

- **Total fertility rate:** The total fertility rate is 2.0 children per woman, which declined from 2.2 children in 2015-16 and is currently below the replacement level of fertility of 2.1 children per woman.
- **Birth intervals:** The median birth interval is 33 months since the preceding birth.
- **Age at first birth:** The median age at first birth among women age 25-49 is 21.2 years.
- **Teenage childbearing:** Seven percent of women age 15-19 have begun childbearing, which is just a one percent decline from 2015-16.
- **Desire for another child:** About one-fourth (23%) of currently married women age 15-49 want to have another child.
- **Wanted fertility rate:** The wanted fertility rate is 1.6 children per woman and ranges from 0.9 children in Sikkim to 2.7 children in Meghalaya.

The number of children that a woman bears depends on many factors, including the age she begins childbearing, how long she waits between births, and her fecundity. Postponing first births and extending the interval between births have played a role in reducing fertility levels in many countries. These factors also have positive health consequences. In contrast, short birth intervals (of less than 24 months) can lead to harmful outcomes for both newborns and their mothers, such as preterm birth, low birth weight, and death. Childbearing at a very young age is associated with an increased risk of complications during pregnancy and childbirth and higher rates of neonatal mortality.

This chapter describes the current level of fertility in India and some of its proximate determinants. It presents information on the total fertility rate, birth intervals, insusceptibility to pregnancy (due to postpartum amenorrhoea, postpartum abstinence, or menopause), age at first birth, and teenage childbearing.

### 4.1 CURRENT FERTILITY

#### Total fertility rate (TFR)

The average number of children a woman would have by the end of her childbearing years if she bore children at the current age-specific fertility rates. Age-specific fertility rates are calculated for the three years before the survey, based on detailed birth histories provided by women.

**Sample:** Women age 15-49

The total fertility rate (TFR) in India is 2.0 children per woman (**Table 4.1**), which is slightly lower than the replacement level of fertility of 2.1 children per woman. Women in rural areas have higher fertility, on average, than women in urban areas (TFR of 2.1 versus 1.6 children).

### Figure 4.1 Trends in Fertility by Residence

Total fertility rate for the three years before the survey

**Trends:** The TFR has declined noticeably in India over time. Between 1992-93 and 2019-21, the TFR declined from 3.4 children to 2.0 children (a decrease of 1.4 children) (**Figure 4.1**). The TFR among women in rural areas has declined from 3.7 children in 1992-93 to 2.1 children in 2019-21. The corresponding decline among women in urban areas was from 2.7 children in 1992-93 to 1.6 children in 2019-21. In all NFHS surveys, irrespective of place of residence, the fertility rate peaks at age 20-24, after which it declines steadily. (**Figure 4.3**)

### Patterns by background characteristics

- The number of children per woman declines with women's level of schooling. Women with no schooling have an average of 2.8 children, compared with 1.8 children for women with 12 or more years of schooling (**Table 4.2**).
- Women in the lowest wealth quintile have an average of 1.0 more children than women in the highest wealth quintile (TFR of 2.6 children versus 1.6 children) (**Figure 4.2**).
- The TFR varies from a low of 1.4 children per woman among Buddhists/Neo-Buddhists to a high of 2.4 children per woman among Muslims.
- The TFR ranges from 1.1 children per woman in Sikkim to 3.0 children per woman in Bihar (**Table 4.3**).
- Thirty-one states and union territories, including all the states in the south region, the west region, and the north region have fertility below the replacement level of 2.1 children per woman.

**Figure 4.2 Fertility by Household Wealth**

Total fertility rate for the three years before the survey

**Figure 4.3 Trends in Age-specific Fertility Rates**

Births per 1,000 women

- Age-specific fertility rates in the five-year period before the survey show that fertility has declined in all age cohorts from NFHS-3 to NFHS-5. Among women age 15-19 years, fertility has declined from 90 to 43; for women age 20-24 years, it has declined from 209 to 165, and for women age 25-29 years, it has declined from 139 to 122 (**Table 4.1** and **Figure 4.3**).

## 4.2 CHILDREN EVER BORN AND LIVING

NFHS-5 collected data on the number of children ever born to women age 15-49 and those still living. On average, women age 45-49 have given birth to 3.1 children over their lives. Of these, 2.8 children survived to the time of the survey. Currently married women age 45-49 had an average of 3.2 children, and 2.9 of these were alive at the time of the survey (**Table 4.5**).

## 4.3 BIRTH ORDER

Among the births in the three years preceding the survey, 40 percent were of birth order one, 34 percent were second-order births, 15 percent were third-order births, and the rest were of birth order four or higher (**Table 4.6**).

**Trends:** Among births in the three years preceding the survey, 12 percent were of birth order four or higher, compared with 14 percent in 2015-16.

### Patterns by background characteristics

- The percentage of births of order four or more declines steadily for higher wealth quintiles (from 22% of the births to women in the lowest wealth quintile to 3% of the births to women in the highest wealth quintile).
- Thirteen percent of births were fourth-order births or higher in rural areas, compared with 8 percent in urban areas.
- Thirty-two percent of births to women with no schooling were of birth order four or higher, compared with 2 percent of births to women with 12 or more years of schooling.

## 4.4 BIRTH INTERVALS

### Median birth interval

Number of months since the preceding birth by which half of the children are born.

**Sample:** Non-first births in the five years before the survey

Short birth intervals (<24 months) are associated with increased health risks for both mothers and newborns. The median birth interval in India is 32.7 months (**Table 4.7**). Twenty-seven percent of births occurred less than 24 months since the preceding birth (**Figure 4.4**).

### Patterns by background characteristics

- Births to older women occurred after longer intervals than births to younger women. The median birth interval among women age 40-49 is 29 months longer than the median among women age 15-19 (50.1 months versus 21.0 months).
- Births to women in wealthier households occurred after longer birth intervals. The median birth interval in the highest wealth quintile is 11 months longer than in the lowest quintile (41.3 months versus 30.5 months).
- The median birth interval is 10 months longer if the preceding birth is living than if the preceding birth has died.
- Among the religious groups, the median birth interval is the lowest among Hindus (32.3 months) and the highest among Jains (48.2 months).
- Birth intervals are longer for births to women with 12 or more years of schooling than women with no schooling (36.1 months versus 30.9 months)

## 4.5 AGE AT FIRST BIRTH

### Median age at first birth

Age by which half of the women have had their first child.

**Sample:** Women age 25-49

The median age at first birth among women age 25-49 in India is 21.2 years (**Table 4.8**).

**Figure 4.4 Birth Intervals**

*Percent distribution of non-first order births by number of months since the preceding birth*

### Patterns by background characteristics

- Women age 25-49 in urban areas have their first birth, on average, more than 1 year later than women in rural areas (22.3 years versus 20.8 years) (**Table 4.9**).
- The median age at first birth increases from 19.9 years or less among women age 25-49 with no schooling or less than 5 years of schooling to 24.9 years among women with 12 or more years of schooling (**Figure 4.5**).
- The median age at first birth to women in the highest wealth quintile is 2.9 months longer than for women in the lowest wealth quintile (23.2 months versus 20.3 months).

**Figure 4.5 Median Age at First Birth by Schooling**

*Among women age 25-49*

## 4.6 MENSTRUAL PROTECTION

### Hygienic methods of protection during the menstrual period

Women who use locally prepared napkins, sanitary napkins, menstrual cups, or tampons during their menstrual period.

**Sample:** Women age 15-24

Using a hygienic method of menstrual protection is important for women's health and personal hygiene. In NFHS-5, women age 15-24 were asked what method or methods they use for menstrual protection, if anything. In India, 64 percent use sanitary napkins, 50 percent use cloth, and 15 percent use locally prepared napkins. Overall, 78 percent of women in this age group use a hygienic method of menstrual protection (**Table 4.13**).

### Patterns by background characteristics

- Women with 12 or more years of schooling are more than twice as likely to be using a hygienic method as women with no schooling (90% versus 44%).
- Women in the highest wealth quintile are almost twice as likely to use a hygienic method as women in the lowest wealth quintile (95% versus 54%).
- Seventy-three percent of rural women use a hygienic method of menstrual protection, compared with 90 percent of urban women.
- The lowest percentage of women use a hygienic method of menstrual protection in Bihar (59%), Madhya Pradesh (61%), and Meghalaya (65%) (**Table 4.14**).

## 4.7 BATHING PRACTICES DURING MENSTRUAL PERIOD

### Bathing practices during menstrual period

Percentage of women who take a bath during their menstrual period, and take a bath in the same bathroom used by other household members.

**Sample:** Women age 15-49 who had a menstrual period in the six months before the survey

In NFHS-5, women age 15-49 who had a menstrual period in the last six months reported that 96 percent take a bath during their menstrual period. Ninety-two percent take a bath during their menstrual period in the same bathroom where other household members take a bath (**Table 4.15**).

### Patterns by background characteristics

- Overall, 96 percent of women in urban areas and 91 percent of women in rural areas take a bath during their menstrual period in the same bathroom where other household members take a bath.
- Women with 12 or more years of schooling are more likely (97%) to take a bath during their menstrual period than women with no schooling (94%).
- Jain and Hindu women (98-99%) are more likely to take a bath during their menstrual period than Muslim women (88%). Almost all Sikh, Buddhist/Neo Buddhist, and Jain women take a bath in the same bathroom where other household members take a bath.
- Ninety-seven percent of women from the highest wealth quintile take a bath during their menstrual period in the same bathroom where other household members take a bath, compared with 85 percent of women in the lowest wealth quintile.
- More than 90 percent of women across the states and union territories take a bath during their menstrual period, except in Ladakh (37%), Jammu and Kashmir (43%), Meghalaya (84%), and Manipur (85%). Ninety percent or more take a bath in the same bathroom used by other household members, except in Odisha (72%), West Bengal and Tripura (75% each), Tamil Nadu (85%), Puducherry, Gujarat, and Assam (88% each), and Meghalaya (89%) (**Table 4.16**).

## 4.8 TEENAGE CHILDBEARING

### Teenage childbearing

Women who have given birth or are pregnant with their first child.

**Sample:** Women age 15-19

In India, 7 percent of women age 15-19 have begun childbearing; 5 percent of women have had a live birth and 2 percent of women are pregnant with their first child (**Table 4.10**).

**Trends:** The level of teenage childbearing declined slightly between 2015-16 (8%) and 2019-21 (7%).

### Patterns by background characteristics

- Teenage pregnancy is relatively high in rural areas. Eight percent of women in rural areas in the age group 15-19 have begun childbearing (**Table 4.10**).

- The level of teenage pregnancy decreases with an increasing level of schooling. Eighteen percent of women age 15-19 with no schooling have already begun childbearing, compared with only 4 percent of women who had 12 or more years of schooling.
- Childbearing among women age 15-19 decreases with the level of wealth. Only 2 percent of teenage women in the highest wealth quintile have begun childbearing, compared with 10 percent of teenage women in the lowest wealth quintile.
- Teenage childbearing is higher among scheduled tribe women age 15-19 years (9%) than the other three caste/tribe groups.
- Teenage childbearing is higher among Muslim women age 15-19 years (8%) than the other religious groups.
- More than half (53%) of currently married women age 15-19 have already begun childbearing.
- Tripura (22%), West Bengal (16%), Andhra Pradesh (13%), Assam (12%), Bihar (11%), and Jharkhand (10%) have higher levels of teenage pregnancy than other states and union territories (**Table 4.11** and **Figure 4.6**).

**Figure 4.6 Teenage Motherhood by State/UT**

*Percentage of women age 15-19 who have begun childbearing*

Information on fertility preferences can help family planning programme planners assess the desire for children, the extent of mistimed and unwanted pregnancies, and the demand for contraception to space or limit births. This information may suggest the direction that fertility patterns will take in the future.

This section presents information on whether and when married women and men want more children, ideal family size, whether the last birth was wanted at that time, and the theoretical fertility rate if all unwanted births were prevented.

## 4.9 DESIRE FOR ANOTHER CHILD

### Desire for another child

Women and men were asked whether they wanted more children and, if so, how long they would prefer to wait before the next child. Women and men who are sterilized are assumed not to want any more children.

**Sample:** Currently married women and men age 15-49

Nearly one in four (23%) currently married women age 15-49 want to have another child. Twelve percent of women want to have a child soon and 10 percent want to wait at least two years before having another child. Most other women want to limit childbearing: 32 percent want no more children and 38 percent are sterilized. Similar to women, a little over one in four (26%) currently married men age 15-49 want to have another child. Thirteen percent of men want to have another child soon, 11 percent want to wait at least two years before having another child, 61 percent want no more children, and 10 percent are sterilized or have wives who are sterilized (**Table 4.12**). Eighty-six percent of women with two living children (including those who are sterilized) do not want any more children (**Table 4.17**).

**Trends:** The percentage of currently married women age 15-49 who want no more children (including women who were sterilized) was slightly lower in 2015-16 (68%) than in 2019-21 (70%).

### Patterns by background characteristics

- The proportion of currently married women who want no more children increases with age. Only 25 percent of currently married women age 15-24 want no more children, compared with 66 percent age 25-34 years and 89 percent age 35-49.
- Seventy-two percent of Sikh and 71 percent of Hindu currently married women age 15-49 want no more children, compared with 64 percent of Muslim currently married women.
- Sixty-five percent of currently married women age 15-49 with two living daughters and no sons want no more children, compared with 91 percent with two sons and no daughters. The pattern is similar for men, indicating that son preference is still an important factor in overall fertility preferences in India (**Figure 4.7**).
- The desire of women not to have any more children is relatively low in the northeast states except Tripura, Sikkim, and Assam, in Bihar (66%) in the East, Goa (60%) in the West, Ladakh (48%) and Jammu & Kashmir (52%) in the North, and Kerala (64%) in the South. Among the union territories, Lakshadweep has the lowest percentage of women (40%) desiring no more children (**Table 4.18**).

**Figure 4.7** Currently Married Women and Men Age 15-49 with Two Children Who Want No More Children by Number of Living Sons

## 4.10 IDEAL FAMILY SIZE

### Ideal family size

Respondents with no children were asked, “If you could choose exactly the number of children to have in your whole life, how many would that be?” Respondents who had children were asked: “If you could go back to the time when you did not have any children and could choose exactly the number of children to have in your whole life, how many would that be?”

**Sample:** Women and men age 15-49

If both men and women age 15-49 were given a chance to choose their family size, they would both want to have an average of 2.1 children (**Table 4.19.1** and **Table 4.19.2**). The composition of the ideal family among women age 15-49 comprises an average of 1.0 ideal number of sons, 0.9 daughters, and 0.2 children of either of sex, which is almost the same as the current total fertility rate. About four-fifths (81%) of women age 15-49 want at least one son and a similar proportion (79%) want at least one daughter. Only 3 percent of women want to have more daughters than sons, whereas 15 percent want to have more sons than daughters. The mean ideal number of sons and daughters among men is almost the same as among women. About four-fifths (81%) of men want at least one son, and 76 percent want at least one daughter. The mean ideal number of sons and daughters among men is almost the same as among women. The percentage of men who want more sons than daughters (16%) and want more daughters than sons (4%) are almost the same as the sex preferences for women.

**Trends:** The average ideal family size among women age 15-49 has declined only marginally, from 2.2 in 2015-16 to 2.1 in 2019-21.

### Patterns by background characteristics

- Older women want somewhat larger families than younger women. The average ideal family size increases from 1.8 children among women age 15-19 to 2.3 children among women age 40-49.
- The ideal family size declines with an increasing level of education among women. Women with no schooling consider 2.5 children to be ideal, compared with 1.8 children for women with 12 or more years of schooling.
- The average ideal size of the family decreases with increasing wealth status. The mean ideal family size is 2.4 children among women in the lowest wealth quintile, compared with 2.0 children among women in the highest quintile. A similar pattern is observed among men 15-49.
- Women in Mizoram (3.6), Meghalaya (3.2), Nagaland (3.0), Arunachal Pradesh and Manipur (2.7 each), Bihar (2.5), and Ladakh, Uttar Pradesh, Jharkhand, and Lakshadweep (2.4 each) have the highest ideal number of children. Bihar (31%), Mizoram (27%), Arunachal Pradesh (25%), Jharkhand (24%), and Manipur and Uttar Pradesh (23% each) have the highest proportion of women who want more sons than daughters in their ideal family size, and the lowest proportion is in Chandigarh (5%) and Goa, Andhra Pradesh, and Puducherry (6% each) (**Table 4.20**).

## 4.11 FERTILITY PLANNING STATUS

### Planning status of birth

Women reported whether their most recent birth was wanted at the time (planned birth), at a later time (mistimed birth), or not at all (unwanted birth).

**Sample:** Current pregnancies and births in the five years before the survey to women age 15-49

Mothers reported that 92 percent of births in the five years preceding the survey (including current pregnancies) were wanted at the time of conception, 4 percent were unwanted at the time of conception, and 4 percent were mistimed or wanted at a later date (**Table 4.21**).

**Trends:** The percentage of births that were wanted at the time increased negligibly from 91 percent in 2015-16 to 92 percent in 2019-21.

#### Patterns by background characteristics

- The more children a woman has, the more likely it is that her birth was unwanted. Only 0.6 percent of first-order births were unwanted, compared with 7 percent of third-order births and 13 percent of fourth or higher-order births.
- The percentage of unwanted births increases with the mother's age, ranging from 1 percent of births to women less than 20 years of age to 15 percent of births to women age 45-49.

## 4.12 WANTED FERTILITY RATES

### Unwanted birth

Any birth in excess of the number of children a woman reported as her ideal number.

### Wanted birth

Any birth less than or equal to the number of children a woman reported as her ideal number.

### Wanted fertility rate

The average number of children a woman would have by the end of her childbearing years if she bore children at the current age-specific fertility rates, excluding unwanted births.

**Sample:** Women age 15-49

The total wanted fertility rate indicates the level of fertility that would result if all unwanted births were prevented. The total wanted fertility rate in India is 1.6 children per woman, compared with the actual total fertility rate of 2.0 children (Table 4.22).

**Trends:** The total wanted fertility rate in India slightly declined from 2015-16 (1.8 children) to 2019-21 (1.6 children). The gap between the actual and wanted fertility rates for both surveys (2015-16 and 2019-21) is the same (0.4 each) (Figure 4.8).

**Figure 4.8 Trends in Wanted and Actual Fertility**

#### Patterns by background characteristics

- The gap between the actual and wanted fertility rate is 0.4 children among women age 15-49 in rural areas, compared with 0.2 children among women in urban areas.
- The total wanted fertility rate for women with no schooling is 2.2 children, compared with only 1.6 children for women with 12 or more years of schooling. The gap between the actual and wanted fertility rates is much higher among women with no schooling (0.6) than women with 12 or more years of schooling (0.2).
- Household wealth status not only affects wanted fertility but also affects the gap between the actual and wanted fertility rates. The level of wanted fertility declines with rising levels of wealth, as does the gap between actual and wanted

fertility. The wanted fertility rate is 2.0 children among women in the lowest wealth quintile and 1.4 children among women in the highest quintile. The gap between actual and wanted fertility is 0.6 children for women in the lowest wealth quintile, but only 0.2 children for women in the highest quintile.

- In India, only two states have a wanted fertility rate above the replacement level of fertility—Meghalaya (2.7) and Bihar (2.2), (**Table 4.23**).
- The gap between the actual and wanted fertility rate is 0.5 children or more only in Bihar (0.8) and Uttar Pradesh (0.5).

## LIST OF TABLES

For more information on fertility levels and fertility preferences, see the following tables:

| 30-34     | 50     | 49    | 50    | 44     | 55    | 51    | 48     | 69    | 62    |
| 35-39     | 13     | 15    | 14    | 12     | 20    | 17    | 13     | 31    | 25    |
| 40-44     | 3      | 3     | 3     | 2      | 5     | 4     | 4      | 9     | 7     |
| 45-49     | 0      | 1     | 1     | 0      | 2     | 1     | 1      | 4     | 3     |
| TFR 15-49 | 1.63   | 2.14  | 1.99  | 1.75   | 2.41  | 2.18  | 2.06   | 2.98  | 2.68  |
| CBR       | 14.0   | 18.6  | 17.1  | 15.8   | 20.7  | 19.0  | 18.8   | 25.0  | 23.1  |

Note: Rates are for the period 1-36 months preceding the survey (approximately 2003-05 for NFHS-3, 2013-15 for NFHS-4, 2017-19 for NFHS-5). Age-specific fertility rates are expressed per 1,000 women. Rates are for the period 1-36 months preceding the interview.

TFR = Total fertility rate, expressed per woman

CBR = Crude birth rate, expressed per 1,000 population

**Table 4.2 Fertility by background characteristics**

Total fertility rate for the 3 years preceding the survey, percentage of women age 15-49 currently pregnant, and mean number of children ever born to women age 40-49 by background characteristics, India, 2019-21

| Background characteristic | Total fertility rate | Percentage currently pregnant | Mean number of children ever born to women age 40-49 |
|---------------------------|----------------------|-------------------------------|------------------------------------------------------|
| <b>Residence</b>          |                      |                               |                                                      |
| Urban                     | 1.63                 | 3.0                           | 2.57                                                 |

Note: Table is based on women age 15-24 who have ever menstruated.

<sup>1</sup> Respondents may report multiple methods so the sum may exceed 100 percent

<sup>2</sup> Locally prepared napkins, sanitary napkins, tampons, and menstrual cups are considered to be hygienic methods of protection

Table 4.14 Menstrual protection by state/union territory

Percentage of women age 15-24 who have ever menstruated by type of protection used during their menstrual period, according to state/union territory, India, 2019-21

| State/union territory                | Type of menstrual protection <sup>1</sup> |                          |                  |         |               |       |         | Number of women | Percentage using a hygienic method <sup>2</sup> |

Note: Women who have been sterilized or whose husband has been sterilized are considered to want no more children. Men who have been sterilized or who mention in response to the question about desire for children that their wife has been sterilized are considered to want no more children. Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. na = Not applicable

<sup>1</sup> Includes current pregnancy of woman/wife

<sup>2</sup> Excludes pregnant women and men with pregnant wives

Note: Women who have been sterilized or whose husband has been sterilized are considered to want no more children. Men who have been sterilized or who mention in response to the question about desire for children that their wife has been sterilized are considered to want no more children. Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Includes current pregnancy of woman/wife

**Table 4.19.1 Indicators of sex preference: Women**

Mean ideal number of sons, daughters, and children of either sex for women age 15-49, percentage who want more sons than daughters, percentage who want more daughters than sons, percentage who want at least one son, and percentage who want at least one daughter by background characteristics, India, 2019-21, and total for NFHS-4

| Background characteristic           | Mean ideal number of |           |            | Percent who want more sons than daughters | Percent who want more daughters than sons | Percent who want at least one son | Percent who want at least one daughter | Number of women |

Note: Rates are calculated based on births to women age 15-49 in the period 1-36 months preceding the survey. The total fertility rates are the same as those presented in Table 4.3.

### Key Findings

- **Modern contraceptive use:** Modern contraceptive use by currently married women has increased from 48 percent to 56 percent between 2015-16 and 2019-21. Female sterilization is still the most popular contraceptive method, used by 38 percent of currently married women.
- **Source of modern contraceptive methods:** Sixty-eight percent of modern contraceptive method users obtained the method from the public health sector.
- **Contraceptive discontinuation:** In the five years preceding the survey, 50 percent of the women who started using a contraceptive method discontinued the method in less than 12 months. The leading reason for discontinuation is a desire to become pregnant (11%).
- **Unmet need for family planning:** Nine percent of currently married women have an unmet need for family planning, down from 13 percent since 2015-16.
- **Hysterectomy:** Three percent of women have had a hysterectomy. More than two-thirds (70%) of hysterectomies were performed in the private health sector.

Couples can use contraceptive methods to limit or space the number of children they have. This chapter presents information on the knowledge and use of contraceptive methods, sources of contraceptive methods, informed choice of methods, and rates and reasons for discontinuing contraceptives. The chapter also provides information on how men perceive contraception and women using contraceptives. It also examines the unmet need for family planning and exposure to family planning messages. Finally, this chapter includes the prevalence of hysterectomy by state/UT and socio-demographic characteristics.

## 5.1 CONTRACEPTIVE KNOWLEDGE AND USE

Knowledge of contraceptive methods is almost universal in India, with more than 99 percent of currently married women and men age 15-49 knowing at least one method of contraception. More than half of currently married women (52%) and men (52%) know about emergency contraception. More than half of currently married women and more than one-quarter of currently married men know about the lactational amenorrhoea method (LAM) (Table 5.1).

### Contraceptive prevalence rate (CPR)

Percentage of women who use any contraceptive method

**Sample:** All women, currently married women, and sexually active unmarried women age 15-49

Overall, the contraceptive prevalence rate (CPR) is 67 percent of currently married women age 15-49. More than half (56%) of currently married women use a modern method. Only 28 percent of currently married women age 15-19 use a contraceptive method and 19 percent use a modern contraceptive method. Among sexually active, unmarried women age 15-49, more than half (55%) use a contraceptive method and almost all of them (51%) use a modern contraceptive method (**Table 5.5**).

**Modern methods**

Include male and female sterilization, injectables, intrauterine devices (IUDs/ PPIUDs), contraceptive pills, implants, female and male condoms, diaphragm, foam/jelly, the standard days method, the lactational amenorrhoea method, and emergency contraception

Female sterilization remains the most popular modern contraceptive method. Among currently married women age 15-49, 38 percent use female sterilization, followed by male condoms (10%) and pills (5%). Ten percent use a traditional method, mostly the rhythm method (**Figure 5.1**). Among sexually active unmarried women, male condoms are the most commonly used method (27%), followed by female sterilization (21%).

**Trends:** The contraceptive prevalence rate among currently married women age 15-49 increased from 54 percent in 2015-16 to 67 percent in 2019-21 (**Table 5.2**). Among sexually active unmarried women age 15-49, the use of condoms/*Nirodhs* increased from 12 percent in 2015-16 to 27 percent in 2019-21

**Patterns by background characteristics**

- Contraceptive use among currently married women rises with an increasing number of living children from 17 percent of women with no living children to 52 percent of women with one child and 80 percent of women with three children (**Table 5.3.1**).
- By employment status, 53 percent of women who are not employed use a modern contraceptive method, compared with 66 percent of women who are employed for cash (**Table 5.3.1**).
- Modern contraceptive use increases with wealth, from 51 percent of women in the lowest wealth quintile to 59 percent of women in the highest quintile (**Table 5.3.1** and **Figure 5.2**).
- Almost two-thirds of Buddhist/Neo-Buddhist women (64%) use modern contraception, compared with 47 percent of Muslim women (**Table 5.3.1**).
- Half of the women who undergo sterilization have the operation by the age of 25.7 years (**Table 5.6**), the same as in NFHS-4.

**Figure 5.1 What Contraceptive Methods do Women Use?**  
Currently married women age 15-49

**Figure 5.2 Use of Modern Contraceptive Methods by Household Wealth**

Percentage of currently married women age 15-49

- Among the states, the use of contraceptive methods is the lowest in Meghalaya (27%), Mizoram (31%), and Bihar (56%), and highest in West Bengal, Odisha, and Himachal Pradesh (74% each). Among the states, a relatively low proportion of currently married women use contraceptive methods in all of the smaller states in the northeast region except for Sikkim and Tripura. Among the union territories, the use of contraceptive methods is the lowest in Ladakh (51%) and the highest in Chandigarh (77%) (**Table 5.2** and **Figure 5.3**).
- There is a large variation in the use of modern contraceptive methods across districts in India, ranging from 11 to 81 percent. Districts with the lowest use of modern contraceptive methods are East Khasi Hills (12%), Ukhurul (12%), West Khasi Hills (15%), and South West Khasi Hills and Imphal West (16% each). Districts with the highest use of modern contraceptive methods are Nagpur (81%); Balod, Indore, and Chikmagalur (80% each); and Chamarajanagar (79%) (**Map 5.1**).

**Figure 5.3 Use of Contraceptive Methods by State/UT**

*Percentage of currently married women age 15-49*

**Map 5.1: Currently married women age 15-49 who use any modern contraceptive method, NFHS-5, 2019-21**

## 5.2 SOURCE OF MODERN CONTRACEPTIVE METHODS

### Source of modern contraceptives

The place where the modern method currently being used was obtained the last time it was acquired

**Sample:** Women age 15-49 currently using a modern contraceptive method

Almost seven in 10 (68%) modern method contraceptive users obtained their method from the public health sector. The rest of the users of modern methods obtained their method from the private health sector, including NGOs or trust hospitals/clinics (25%) and other sources (7%), including shops, their husband, friends, and relatives. A lower proportion of urban users (55%) than rural users (74%) obtained their method from the public health sector (**Table 5.9** and **Figure 5.4**).

The public health sector is the major source of female and male sterilization, IUDs/PPIUDs, and injectables, whereas the private health sector is the major source of pills, injectables, and condoms/*Nirodhs* (**Table 5.8**).

- Female sterilization: More than eight in 10 (81%) women who got sterilized underwent the procedure in a public health sector facility, mostly a government/municipal hospital or a CHC/rural hospital/Block PHC.
- Pill: Nearly half (45%) of pill users received their supply from the private health sector, and 41 percent received their supply from the public health sector.
- Male condoms, injectables, and IUDs/PPIUDs: Two-fifths of users of male condoms, 30 percent of users of injectables, and about one-quarter (24%) of users of IUDs/PPIUDs obtained the method from the private health sector.

The lowest use of the public health sector as a source for modern contraceptives was in Tripura (39%), followed by Delhi (44%), and Manipur and Assam (49% each). In contrast, among the states, 85 percent of modern contraceptive method users in Madhya Pradesh and Chhattisgarh obtained their method from the public health sector, followed by 81 percent in Karnataka. Use of the public health sector for modern contraceptive methods is also very high in the union territories of Ladakh (92%) Puducherry (83%), and the Andaman & Nicobar Islands (83%). Two-thirds of male condom users in Mizoram (67%), 62 percent in Sikkim, and 53 percent in Kerala obtained their method from the public health sector, compared with only 12 percent in Uttarakhand (**Table 5.10**).

Less than one percent of women have ever used emergency contraceptive pills. The major source of emergency contraceptive pills is the private health sector, primarily pharmacies or drugstores (**Table 5.11**).

**Figure 5.4 Source of Modern Contraceptive Methods**

*Percent distribution of women age 15-49 who are current users of modern methods by most recent source of method*

## 5.3 INFORMED CHOICE

### Informed choice

Informed choice refers to women being informed at the time they started the current episode of method use, about the method's side effects, what to do if they experience side effects, and other methods they could use.

**Sample:** Women age 15-49 who are currently using selected modern contraceptive methods and who started the last episode of use within the five years before the survey

Sixty-two percent of women currently using selected modern contraceptives were informed about the possible side effects or problems associated with the method they used, and 54 percent were informed about what to do if they experienced side effects. A higher proportion of women (69%) were informed about other available methods that they could use (**Table 5.12**).

The percentage of women who were informed about possible side effects or problems with their method ranged from 29 percent in Andhra Pradesh to 92 percent in Chandigarh. The percentage given information about what to do if they experienced side effects was lower in every state than the percentage who were told about side effects. Nearly eight in 10 women in Tamil Nadu and Chhattisgarh (78% each) and 87 percent of women in Chandigarh were informed about what to do if they experienced side effects with the method. A large majority of women in Goa (91%), Andaman & Nicobar Islands (91%), Chandigarh (90%), Chhattisgarh (88%), and Tamil Nadu (87%) were informed by a health or family planning worker about other methods they could use (**Table 5.13**).

## 5.4 DISCONTINUATION OF CONTRACEPTIVES

### Contraceptive discontinuation rate

Percentage of contraceptive use episodes discontinued within 12 months.

**Sample:** Episodes of contraceptive use in the five years before the survey for women who are currently age 15-49

One in two episodes of contraceptive use in the five years before the survey were discontinued within 12 months. Contraceptive discontinuation rates for any reason were higher for “other methods” (79%), injectables (66%), condoms/*Nirodhs* (61%), rhythm (60%), withdrawal (59%), and pills (55%) than for IUDs/PPIUDs (35%) (**Table 5.14** and **Figure 5.5**). The most common reason for discontinuing use of the method was that the woman wanted to become pregnant. Only 7 percent of episodes of contraceptive use were discontinued because the woman switched to another method (**Table 5.14**).

**Figure 5.5 Contraceptive Discontinuation Rates for Modern Spacing Methods**

*Percentage of contraceptive episodes discontinued within 12 months among women age 15-49*

Contraceptive discontinuation rates for any method are as low as 9 percent in Karnataka (where almost all contraceptive users were sterilized) and as high as 66 percent in Uttar Pradesh. The discontinuation rate for any spacing method is highest (60-68%) in Chhattisgarh, Madhya Pradesh, Punjab, Karnataka, Kerala, Bihar, and Uttar Pradesh (**Table 5.15**).

## 5.5 EXPOSURE TO FAMILY PLANNING MESSAGES

Three-fourths (75%) of women heard or saw a family planning message in the past few months (60% on television, 56% on a wall painting or hoarding, and only 15% on radio) (**Table 5.16.1**). Older women, women in rural areas, women with little or no schooling, Muslim women, scheduled tribe women, and women in the two lowest wealth quintiles have less exposure to family planning messages.

Exposure to family planning messages is slightly higher for men (78%) than women (75%). About three-fifths of men age 15-49 heard or saw a family planning message in the past few months on a wall painting or hoarding (62%) or on television (57%). Men in rural areas, men having little or no schooling, Sikh and Christian men, men from scheduled tribes, and men in the two lowest wealth quintiles have less exposure to family planning messages (**Table 5.16.2**).

More than one-third of men believe that contraception is women's business and that men should not have to worry about it. Twenty percent of men believe that a woman who uses contraception may become promiscuous. More than half (55%) of men reported that if a male condom is used correctly, it protects against pregnancy most of the time. An additional one-third of men said that a condom sometime protects against pregnancy if it is used correctly (**Table 5.17**).

## 5.6 DEMAND FOR FAMILY PLANNING

### Unmet need for family planning

Proportion of women who (1) are not pregnant and not postpartum amenorrhoeic, are considered fecund, and want to postpone their next birth for 2 or more years or stop childbearing altogether, but are not using a contraceptive method, or (2) have a mistimed or unwanted current pregnancy, or (3) are postpartum amenorrhoeic and their last birth in the last two years was mistimed or unwanted.

**Sample:** All women, currently married women, and sexually active unmarried women age 15-49

|                             |                                                                            |
|-----------------------------|----------------------------------------------------------------------------|
| Demand for family planning: | Unmet need for family planning +<br>current contraceptive use (any method) |
|-----------------------------|----------------------------------------------------------------------------|

|                                 |                                                                                                                    |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Proportion of demand satisfied: | $\frac{\text{Current contraceptive use (any method)}}{\text{Unmet need + current contraceptive use (any method)}}$ |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------|

|                                                   |                                                                                                                           |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Proportion of demand satisfied by modern methods: | $\frac{\text{Current contraceptive use (any modern method)}}{\text{Unmet need + current contraceptive use (any method)}}$ |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|

More than three-fourths of currently married women age 15-49 have a demand for family planning; 14 percent have a demand for spacing births and 63 percent have a demand for limiting births. Sixty-seven percent of currently married women are already using a contraceptive method either to space or to limit births, and therefore have their need met. However, 9 percent of currently married women have an unmet need for family planning, including 4 percent who have an unmet need for spacing births and 5 percent who have an unmet need for limiting births (**Table 5.19** and **Figure 5.6**). If all currently married women who want to space or limit their children were to use a family planning method, the contraceptive prevalence rate would increase from 67 percent to 76 percent.

**Trends:** The total demand for family planning among currently married women age 15-49 in India increased from 66 percent in 2015-16 to 76 percent in 2019-21 (**Table 5.20**). The unmet need for family planning methods has decreased from 13 percent in NFHS-4 to 9 percent in NFHS-5.

#### Patterns by background characteristics

- Unmet need for family planning methods among currently married women ranges from a low of 3 percent among women age 45-49 to a high of 18 percent among women age 15-19 (**Table 5.19**).
- Unmet need for family planning methods generally increases with increasing years of schooling, from 7 percent among currently married women with no schooling to 13 percent among those who have completed 12 or more years of schooling.
- Unmet need for family planning methods is highest in Meghalaya (27%) and Mizoram (19%). Unmet need is less than 10 percent in most of the remaining states except Maharashtra, Punjab, Gujarat, Assam, Jharkhand, Sikkim, Manipur, Arunachal Pradesh, Kerala, Uttar Pradesh, and Bihar where it varies between 10 and 15 percent. Unmet need is lowest in Andhra Pradesh (5%) and in Delhi, Karnataka, and Telangana (6% each) (**Table 5.20** and **Figure 5.7**).

**Figure 5.6 Demand for Family Planning**

*Currently married women age 15-49*

**Figure 5.7 Unmet Need for Family Planning by State/UT**

*Percentage of currently married women age 15-49*

## 5.7 HYSTERECTOMY

### Hysterectomy

Hysterectomy is surgery that involves partial or complete removal of the uterus of a woman.

**Sample:** Women age 15-49 who are currently not menstruating for more than 6 months, not pregnant or unsure.

Three percent of women age 15-49 have had a hysterectomy. The median age for hysterectomy is 34.6 years among women age 15-49. More than two-thirds (70%) of women who have undergone a hysterectomy had the operation in a private health facility. The prevalence of hysterectomy is the highest in Andhra Pradesh (9%), followed by Telangana (8%), and lowest in Sikkim (0.8%) and Meghalaya (0.7%) (Tables 5.21 and 5.22).

## List of Tables

For more information on family planning, see the following tables:

| Tables       |                                                                                                          |

Note: All information in this table is based on women's reports. Table includes all users of modern contraceptive methods except the lactational amenorrhoea method (LAM) regardless of marital status.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device

AYUSH = Ayurveda, yoga and naturopathy, unani, siddha, and homeopathy; UHC = Urban health centre; UHP = Urban health post; UFWC = Urban family welfare centre; CHC = Community health centre; PHC = Primary health centre; ANM = Auxiliary nurse midwife; ICDS = Integrated Child Development Services; ASHA = Accredited Social Health Activist; NGO = Nongovernmental organization; TBA = Traditional birth attendant

<sup>1</sup> Excludes standard days method, lactational amenorrhoea method (LAM), and "other" modern methods

Table 5.10 Public sector as source of modern contraceptives by state/union territory

Percentage of current users of modern contraceptive methods for whom the most recent source of contraceptives was the public sector, by specific method and residence, according to state/union territory, India, 2019-21

| State/union territory | Female sterilization | Male sterilization | Pill | IUD or PPIUD | Injectables | Condom/<br><i>Nirodh</i> | Emergency contraception | All modern methods |       |       |

Note: All information in this table is based on women's reports. Table includes all users of modern contraception regardless of their marital status. Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device

Table 5.11 Use and source of emergency contraceptive pills

Percentage of women who have ever used emergency contraceptive pills and percentage who have used emergency contraceptive pills in the last 12 months, and among those who used emergency contraceptive pills in the last 12 months, the percent distribution by the number of times the pills were used and the percentage of users by source from which the method was obtained, according to residence, India, 2019-21

| Source                                                                                                                                                         | Urban | Rural | Total |

| Number of users of emergency contraceptive pills in the past 12 months                                                                                         | 698   | 967   | 1,665 |

Note: All information in this table is based on women's reports. Table includes all users of emergency contraceptive pills regardless of their marital status.

AYUSH = Ayurveda, yoga and naturopathy, unani, siddha, and homeopathy; UHC = Urban Health Centre; UHP = Urban health post; UFWC = Urban family welfare centre; CHC = Community health centre; PHC = Primary health centre; ANM = Auxiliary nurse midwife; ICDS = Integrated Child Development Services; ASHA = Accredited Social Health Activist; NGO = Nongovernmental organization; TBA = Traditional birth attendant

Table 5.12 Informed choice

Among women who are current users of selected modern contraceptive methods who started the last episode of use within the 5 years preceding the survey, the percentage who were informed about possible side effects or problems of that method, the percentage who were informed about what to do if they experienced side effects, percentage who were ever told by a health or family planning worker about other methods of family planning they could use, and percentage who were informed of all three, by method, according to residence, India, 2019-21

| Method                            | Percentage who were informed about side effects or problems of method used | Percentage who were informed about what to do if experienced side effects | Percentage who were informed by a health or family planning worker about other methods that could be used | Percentage who were informed of all three (Method Information Index) | Number of women |

Note: Table includes only the contraceptive methods separately shown in the table and excludes users who obtained their method from friends/relatives or husband.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device

<sup>1</sup> Among women who were sterilized in the five years preceding the survey

Table 5.13 Informed choice by state/union territory

Among women who are current users of modern contraceptive methods who started the last episode of use within the 5 years preceding the survey, the percentage who were informed about possible side effects or problems of that method, the percentage who were informed about what to do if they experienced side effects, percentage who were ever told by a health or family planning worker about other methods of family planning they could use, and percentage who were informed of all three, by state/union territory, India, 2019-21

| State/union territory                | Percentage who were informed about side effects or problems of method used | Percentage who were informed about what to do if experienced side effects | Percentage who were informed by a health or family planning worker about other methods that could be used | Percentage who were informed of all three (Method Information Index) |

Note: Table is based on life table calculations using information on episodes of contraceptive use that began 3-62 months preceding the survey. All methods includes female and male sterilizations, which are not shown separately.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device

<sup>1</sup> Includes infrequent sex/husband away, difficult to get pregnant/menopausal, and marital dissolution/separation

<sup>2</sup> Includes lack of access/too far, costs too much, and inconvenient to use

<sup>3</sup> Reasons for discontinuation are mutually exclusive and add to the total given in this column

<sup>4</sup> The episodes of use included in this column are a subset of the discontinued episodes included in the discontinuation rate. A woman is considered to have switched to another method if she used a different method in the month following discontinuation or if she gave "wanted a more effective method" as the reason for discontinuation and started another method within 2 months of discontinuation.

<sup>5</sup> All episodes of use that occurred within the 5 years preceding the survey are included. Number of episodes of use includes both episodes of use that were discontinued during the period of observation and episodes of use that were not discontinued during the period of observation.

<sup>6</sup> Includes female condom, diaphragm, foam/jelly, standard days method, lactational amenorrhoea method (LAM), and other modern and traditional methods that are not shown separately

<sup>7</sup> Includes pill, IUD/PPIUD, injectables, male condom, female condom, lactational amenorrhoea method (LAM), diaphragm, foam/jelly, and other modern spacing methods that are not shown separately

<sup>8</sup> Includes pill, IUD/PPIUD, injectables, male condom, female condom, lactational amenorrhoea method (LAM), diaphragm, foam/jelly, rhythm, withdrawal, and other modern spacing and traditional methods that are not shown separately

Table 5.15 Twelve-month contraceptive discontinuation rates by state/union territory

Among women age 15-49 who experienced an episode of contraceptive use within the 5 years preceding the survey, the percentage of episodes discontinued within 12 months, by specific method and state/union territory, India, 2019-20

| State/union territory                | Modern method |              |                          | Traditional method |            | All methods | Any modern method | Any spacing method |
|--------------------------------------|---------------|--------------|--------------------------|--------------------|------------|-------------|-------------------|--------------------|
|                                      | Pill          | IUD or PPIUD | Condom/<br><i>Nirodh</i> | Rhythm             | Withdrawal |             |                   |                    |

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA.

<sup>1</sup> Total demand is the sum of unmet need and met need.

<sup>2</sup> Percentage of demand satisfied is met need divided by total demand.

<sup>3</sup> Modern methods include female sterilization, male sterilization, pill, IUD/PPIUD, injectables, male condom, female condom, emergency contraception, standard days method (SDM), diaphragm, foam/jelly, lactational amenorrhoea method (LAM), and other modern methods

Table 5.20 Need and demand for family planning among currently married women by state/union territory and over time

Percentage of currently married women age 15-49 with unmet need for family planning, percentage with met need for family planning, total demand for family planning, and percentage of the demand for family planning that is satisfied, by state/union territory, India, 2019-21, and NFHS-4

| State/union territory | Unmet need for family planning |                 |       | Met need for family planning<br>(currently using) |                 |       | Total demand for family planning <sup>1</sup> |                 |       | Percentage<br>of demand<br>satisfied <sup>2</sup> | Percentage of<br>demand satisfied<br>by modern<br>methods <sup>3</sup> |

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA.

<sup>1</sup> Total demand is the sum of unmet need and met need.

<sup>2</sup> Percentage of demand satisfied is met need divided by total demand.

<sup>3</sup> Modern methods include female sterilization, male sterilization, pill, IUD/PPIUD, injectables, male condom, female condom, emergency contraception, standard days method (SDM), diaphragm, foam/jelly, lactational amenorrhoea method (LAM), and other modern methods

Table 5.21 Hysterectomy

Percentage of women age 15-49 who have had a hysterectomy, and among women with a hysterectomy, percent distribution by place the hysterectomy was performed, according to background characteristics, India, 2019-21

| Background characteristic | Percentage of women who have had a hysterectomy | Number of women | Median age of hysterectomy | Place of hysterectomy                            |                                                                |                                                                     | Total        | Number of women with a hysterectomy |

## OTHER PROXIMATE DETERMINANTS OF FERTILITY

### Key Findings

- **Age at first marriage:** The median age at first marriage is 18.8 years for women and 24.9 years for men age 25-49.
- **Consanguineous marriages:** Eleven percent of marriages are consanguineous marriages, which are more common in all of the southern states except Kerala.
- **Sexual initiation:** The median age at first sexual intercourse is 0.1 years later than the median age at first marriage for women age 20-49.
- **Abortion:** Three percent of pregnancies in the five years preceding the survey resulted in an abortion and 7 percent resulted in a miscarriage.
- **Main reason for abortion:** Almost half of women with an abortion (48%) sought their abortion due to an unplanned pregnancy.
- **Complications from abortions:** Sixteen percent of women with an abortion had complications from the abortion.
- **Widowhood:** One in nine women age 45-49 are widowed.

Marriage and sexual activity help to determine the extent to which women are exposed to the risk of pregnancy. Thus they are important determinants of fertility levels. However, the timing and circumstances of marriage and sexual activity also have profound consequences for women's and men's lives.

### 6.1 MARITAL STATUS

Marriage is nearly universal in India. By age 45-49, only 1 percent of women and 3 percent of men have never been married (**Table 6.1**). Seventy-two percent of women and 60 percent of men age 15-49 are currently married (**Figure 6.1**). Only a small proportion of women (0.2%) and men (0.1%) are married, but the *gauna* ceremony associated with the consummation of marriage has not been performed. Overall, 0.3 percent each of women and men age 15-49 are divorced. Eleven percent of women age 45-49 are widowed, compared with 1 percent of men.

**Trends:** The percentage of women who are currently married has declined slightly, from 73 percent in 2015-16 to 72 percent in 2019-21. The percentage of men who are currently married is almost the same in 2015-16 and 2019-21 (60% each).

## Figure 6.1 Marital Status

Percent distribution of women and men age 15-49

## 6.2 AGE AT FIRST MARRIAGE

### Median age at first marriage

Age by which half of respondents have been married.

**Sample:** Women and men age 25-49

Men tend to marry considerably later than women in India. The median age at first marriage is 19.2 years among women age 20-49 and 24.9 years among men age 25-49 (**Table 6.2**). Thirty-eight percent of women age 20-49 marry before the legal minimum age of marriage of 18 years, and 23 percent of men age 25-49 marry before the minimum legal age of marriage of 21 years.

**Trends:** Early marriage has been declining over time. Marriage before the legal age of 18 is 23 percent for women age 20-24, compared with 47 percent for women age 45-49. Similarly, for men, marriage before the legal age of 21 years has dropped from 27 percent for men age 45-49 to 18 percent for men age 25-29. The median age at first marriage for women age 20-49 slightly increased from 19.0 years in 2015-16 to 19.2 years in 2019-21. For men age 25-49, the median age at first marriage slightly increased between 2015-16 and 2019-21 (from 24.5 to 24.9 years).

### Patterns by background characteristics

- Urban women marry later than rural women. For women age 25-49, the median age at first marriage is 1.9 years higher among urban women than rural women (20.1 versus 18.2 years) (**Table 6.3.1**).
- Women having 12 or more years of schooling marry much later than other women. The median age at first marriage for women age 25-49 increases from 17.1 years for women with no schooling to 22.8 years for women with 12 or more years of schooling (**Figure 6.2**).
- The median age at first marriage for women age 25-49 is higher among Jain women (22.7 years), Christian women (21.7 years), and Sikh women (21.2 years) than women from all other specific religions (18.7-19.7 years).

- Women in the highest wealth quintile marry much later (21.1 years) than women in other wealth quintiles (17.5-19.3 years).

### Figure 6.2 Women's Median Age at First Marriage by Schooling

Among women age 25-49

- Twenty-five percent of women age 18-29 and 15 percent of men age 21-29 marry before reaching the legal minimum age at marriage. About two-fifths of women marry before reaching the legal minimum age at marriage in West Bengal (42%), Bihar (40%), and Tripura (39%), and about one-third of women marry before reaching the legal minimum age at marriage in Jharkhand (35%) and Andhra Pradesh (33%). The percentage marrying before the legal minimum age is 32 percent in Assam, 28 percent in Dadra & Nagar Haveli and Daman & Diu, 27 percent in Telangana, and 25 percent each in Madhya Pradesh and Rajasthan. The percentage of women marrying before reaching the legal minimum age of 18 is lowest in Lakshadweep (4%); Jammu & Kashmir and Ladakh (6% each); Himachal Pradesh, Goa, and Nagaland (7% each), and Kerala and Puducherry (8% each) (**Table 6.4**).
- Overall, 20-25 percent of men age 21-29 in Bihar (25%), Gujarat, Rajasthan, and Madhya Pradesh (24% each), Jharkhand (22%), Arunachal Pradesh (21%), and West Bengal (20%) marry before the legal minimum age of 21 years. The lowest proportions of men marrying below the legal age at marriage are in Lakshadweep and Chandigarh (less than 1%), Kerala (1%), Puducherry, Tamil Nadu, and Nagaland (4% each), Karnataka and Andaman & Nicobar Islands (5% each), Himachal Pradesh and Goa (6% each), and Delhi, Punjab, and Maharashtra (9% each).

## 6.3 CONSANGUINEOUS MARRIAGES

### Consanguineous marriage

Women who report that their husband was related to them by blood before their marriage.

**Sample:** Ever-married women age 15-49

Thirteen percent of ever-married women were related to their husband before their marriage, and 11 percent of marriages were consanguineous marriages (**Table 6.5**). The most common type of consanguineous marriages were marriages to first cousins (8% of all marriages).

### Patterns by background characteristics

- Young women are much more likely than older women to be related to their husbands.
- Women in urban areas are about equally as likely to be in consanguineous marriages as are women in rural areas.
- Muslim and Buddhist/Neo-Buddhist women are the most likely to be in consanguineous marriages.
- Women in all the Southern states except Kerala are much more likely to be in consanguineous marriages than women in other states. More than one-fourth of women in Tamil Nadu, Andhra Pradesh, and Karnataka, and almost one-fifth of women in Telangana and Puducherry reported being in consanguineous marriages (**Table 6.6** and **Figure 6.3**).

### Figure 6.3 Consanguineous Marriages by State/UT

Percent of ever-married women age 15-49

## 6.4 AGE AT FIRST SEXUAL INTERCOURSE

### Median age at first sexual intercourse

Age by which half of respondents have had sexual intercourse.

**Sample:** Women and men age 25-49

In India, the median age at first sexual intercourse is 18.9 years for women age 25-49 (**Table 6.7**). Ten percent of women age 25-49 had sex before age 15, and 39 percent before age 18. By age 20, 60 percent of women age 25-49 have had sexual intercourse (**Table 6.7**).

The median age at first sexual intercourse for men age 25-49 in India is 24.8, six years older than women. One percent of men age 25-49 first had sexual intercourse before age 15, and 6 percent had sexual intercourse before age 18. By age 25, 52 percent of men age 25-49 have had sexual intercourse.

Age at first marriage is widely considered a proxy indicator for the age at which women begin to be exposed to the risks of sexual activity. A comparison of the median age at first intercourse with the median age at first marriage can be used as a measure of whether respondents engage in sex before marriage. The median age at first marriage for women age 25-49 in India (18.8 years) is about the same as the median age at first sexual intercourse (18.9 years). The same pattern is observed for men age 25-49, with a median age at first intercourse of 24.8 years and a median age at first marriage of 24.9 years.

Age at first marriage is widely considered a proxy indicator for the age at which women begin to be exposed to the risks of sexual activity. A comparison of the median age at first intercourse with the median age at first marriage can be used as a measure of whether respondents engage in sex before marriage. The median age at first marriage for women age 25-49 in India (18.8 years) is about the same as the median age at first sexual intercourse (18.9 years). The same pattern is observed for men age 25-49, with a median age at first intercourse of 24.8 years and a median age at first marriage of 24.9 years.

**Trends:** The median age at first sexual intercourse among women age 25-49 was almost the same in 2015-16 (19.0 years) as in 2019-21 (18.9 years). The median age at first sexual intercourse for men age 25-49 increased from 24.3 years in 2015-16 to 24.8 years in 2019-21.

### Patterns by background characteristics

- Urban women age 25-49 begin having sex almost two years later than rural women. The median age at first sex is 20.2 years for women in urban areas, compared with 18.5 years for women in rural areas (**Table 6.8.1**).
- The median age at first intercourse increases with schooling for both women and men. Among women age 25-49, there is a gap of 5.3 years in the median age of first sex between those with no schooling (17.5 years of age) and those with 12 or more years of schooling (22.8 years of age).

## 6.5 RECENT SEXUAL ACTIVITY

NFHS-5 also collected data on recent sexual activity. Thirty-one percent of women and 30 percent of men age 15-49 reported having sexual intercourse within the last week. Twenty-three percent of women and 34 percent of men age 15-49 have never had sexual intercourse. For more information on recent sexual activity, see **Table 6.9.1** and **Table 6.9.2**.

## 6.6 INSUSCEPTIBILITY TO PREGNANCY

### Median duration of postpartum amenorrhoea

Number of months after childbirth by which time half of women have begun menstruating.

**Sample:** Women who gave birth in the three years before the survey

### Median duration of postpartum insusceptibility

Number of months after childbirth by which time half of women are no longer protected against pregnancy either by postpartum amenorrhoea or abstinence from sex.

**Sample:** Women who gave birth in the three years before the survey

Postpartum amenorrhoea refers to the interval between childbirth and the return of menstruation. The length and intensity of breastfeeding influence the duration of amenorrhoea, which offers protection from conception. Postpartum abstinence is the period between childbirth and the time when a woman resumes sexual activity. Eighty-one percent of women are insusceptible to pregnancy two months after a birth. Continued postpartum amenorrhoea and abstinence from sexual intercourse may protect women from pregnancy for longer periods.

During the first six months postpartum, 38 percent of women were amenorrhoeic, 29 percent of women were abstaining from sexual intercourse, and 52 percent were insusceptible to getting pregnant in 2019-21, compared with 42 percent of women who were amenorrhoeic, 25 percent who were practicing abstinence, and 52 percent who were insusceptible in 2015-16.

Among births in the three years before the survey, the median duration of postpartum amenorrhoea is 4.1 months, while the median duration of abstinence from sexual intercourse after giving birth is 3.5 months. Women are insusceptible to pregnancy after childbirth for a median of 6.3 months (**Table 6.10**).

**Trends:** The median duration of postpartum amenorrhoea and insusceptibility has declined since 2015-16. However, the median duration of abstinence has increased marginally. From 2015-16 to 2019-21, the median duration of postpartum amenorrhoea declined from 4.9 months to 4.1 months. The median duration of abstinence increased marginally from 3.4 months in 2015-16 to 3.5 months in 2019-21. During this same period, the median duration of postpartum insusceptibility fell from 6.6 months to 6.3 months.

#### Patterns by background characteristics

- The median duration of postpartum amenorrhoea is slightly longer among women in rural areas than women in urban areas (4.2 months and 3.8 months, respectively).
- Scheduled tribe women remain amenorrhoeic longer (6.2 months) than scheduled caste women (4.1 months), women from other backward classes (3.9 months), and women who are not from scheduled castes, scheduled tribes, or other backward classes (3.5 months).
- The median duration of amenorrhoea declines with increasing wealth quintiles of households, from 5.3 months in the lowest wealth quintile to 3.5 months in the highest wealth quintile (**Table 6.11**).

#### Menopause

Women are considered to have reached menopause if they are neither pregnant nor postpartum amenorrhoeic and have not had a menstrual period in the six months before the survey, or if they report being menopausal or having had a hysterectomy or never having menstruated.

**Sample:** Women age 30-49

Women who have reached menopause are no longer able to become pregnant. Seventeen percent of women age 30-49 are menopausal. The percentage of menopausal women increases with age, rising from 3 percent among women age 30-34 to 55 percent among women age 48-49 (**Table 6.12**).

## 6.7 PREGNANCY OUTCOMES

#### Non-live births

Percentage of women whose pregnancies ended in a non-live birth (abortion, miscarriage, or stillbirth) in the five years preceding the survey

**Sample:** Women age 15-49

Eighty-nine percent of all pregnancies in the five years preceding the survey ended in a live birth, and the remaining 11 percent terminated in an abortion, a miscarriage, or a stillbirth. Miscarriage is the most common type of non-live birth, accounting for 7 percent of all pregnancies, abortions account for 3 percent, and stillbirths account for 1 percent (**Table 6.15**).

**Trends:** In 2019-21, 11 percent of women age 15-49 have experienced a stillbirth, miscarriage, or abortion in their lifetime, compared with 12 percent in 2015-16. The same percentage (4% each) of women age 15-49 had a non-live birth in the five years preceding the NFHS-5 survey and in the NFHS-4 survey.

#### Patterns by background characteristics

- The percentage of women who ever had a non-live birth increases with age until age 30-34 (peaking at 18%) and then declines with age to 14 percent among women age 45-49 years (**Table 6.13**).
- The percentage of pregnancies in the past five years that ended in a non-live birth varies from 8 percent to 16 percent by age, with the highest percentage (13 to 16%) of non-live births in the older ages (age 35-49), and age 15-19 years and 30-34 years (10% each).
- The percentage of all pregnancies in the past five years that ended in a non-live birth was particularly high in Manipur (15%), Goa and Delhi (14% each), Odisha and Himachal Pradesh (12% each), and Haryana and Puducherry (11% each).

- Three percent of last pregnancies in the past five years resulted in an abortion, with a slightly higher percentage among women in urban areas and women in the highest wealth quintile (**Table 6.15**).

### 6.7.1 CHARACTERISTICS OF ABORTIONS

A majority of the abortions were performed in the private health sector (53%), whereas 20 percent were performed in the public health sector. More than one-fourth (27%) of the abortions were performed by the woman herself at home. Sixteen percent of women reporting an abortion said that they had post-abortion complications, and most of them (90%) sought treatment for these complications (**Table 6.17**).

- Almost half of the women (48%) said that the main reason for seeking an abortion was an unplanned pregnancy, followed by her health didn't permit continuing her pregnancy.
- Ten percent of women reported that the last child was too young to have the next birth as the main reason for the abortion.
- Among the remaining reasons, more than one-fourth of women in Ladakh (40%), Lakshadweep (33%), Tamil Nadu (31%), and Telangana (27%) mentioned health concerns as the major reason for getting the abortion. One-fifth to one-third of women in Lakshadweep (32%), Sikkim (28%), Punjab and Jammu & Kashmir (26% each), Himachal Pradesh (24%), and Andhra Pradesh and Kerala (22% each) reported that pregnancy complications were the prime reason for undergoing the abortion.
- Compared with other states and union territories, a higher proportion of women in Puducherry (38%) and Chhattisgarh (25%) reported that they sought the abortion as their last child was too young to have the next birth (**Table 6.18**).

## LIST OF TABLES

For more information on the proximate determinants of fertility, see the following tables:

| Tables      |                                                                                                   |
|-------------|---------------------------------------------------------------------------------------------------|
| Table 6.1   | Current marital status                                                                            |
| Table 6.2   | Age at first marriage                                                                             |

Note: Estimates are based on status at the time of the survey.

na = Not applicable

<sup>1</sup> Includes births for which mothers are either still amenorrhoeic or still abstaining (or both) following birth

<sup>2</sup> Based on a three-month moving average of two month intervals since birth

Table 6.11 Median duration of postpartum amenorrhoea, postpartum abstinence, and postpartum insusceptibility

Median number of months of postpartum amenorrhoea, postpartum abstinence, and postpartum insusceptibility following births in the 3 years preceding the survey, by background characteristics, India, 2019-21

| Background characteristic | Postpartum amenorrhoea | Postpartum abstinence | Postpartum insusceptibility <sup>1</sup> |

## INFANT AND CHILD MORTALITY

### Key Findings

- **Mortality levels:** For the five years preceding the survey, the under-five mortality rate was 42 deaths per 1,000 live births, and the infant mortality rate was 35 deaths per 1,000 live births. The neonatal mortality rate was 25 deaths per 1,000 live births.
- **Trends:** The under-five mortality rate declined from 50 deaths per 1,000 live births in the five years before the 2015-16 survey to 42 deaths per 1,000 live births in the five years before the 2019-21 survey. The infant mortality rate declined from 41 deaths per 1,000 live births to 35 deaths per 1,000 live births during the same period.
- **Patterns:** The under-five mortality rate and infant mortality rate are highest in Uttar Pradesh, followed by Bihar, and are lowest in Puducherry, followed by Kerala. The under-five mortality rate and infant mortality rate are considerably higher in rural areas than in urban areas.
- **Perinatal mortality:** The perinatal mortality rate is 32 deaths per 1,000 pregnancies.

Information on infant and child mortality is relevant to a demographic assessment of the population and is an important indicator of the country's socioeconomic development and quality of life. These estimates can also help identify children who may be at higher risk of death and lead to strategies to reduce this risk, such as promoting birth spacing.

This chapter presents information on levels, trends, and differentials in perinatal, neonatal, infant, and under-five mortality rates. It also examines biodemographic factors and fertility behaviours that increase mortality risks for infants and young children. The information is collected as part of a retrospective birth history, in which female respondents list all of the children they have borne, along with each child's date of birth, survivorship status, and current age or age at death.

The quality of mortality estimates calculated from birth histories depends on the mother's ability to recall all of the children she has given birth to, as well as their birth dates and ages at death. Potential data quality problems include:

- The selective omission from the birth histories of those births that did not survive, which can result in underestimation of childhood mortality.
- The displacement of birth dates, which may distort mortality trends. This can occur if an interviewer knowingly records a birth as occurring in a different year than the one in which it occurred. This may happen if an interviewer is trying to cut down on her overall work load, because live births occurring during the five years before the interview are the subject of a lengthy set of additional questions.
- The quality of reporting of age at death. Misreporting the child's age at death may distort the age pattern of mortality, especially if the net effect of the age misreporting is to transfer deaths from one age bracket to another.

- Any method of measuring childhood mortality that relies on the mothers' reports (i.e., birth histories) assumes that female adult mortality is not high, or if it is high, that there is little or no correlation between the mortality risks of the mothers and those of their children.

Selected indicators of the quality of the mortality data on which the estimates of mortality given in this chapter are presented in Appendix E (Tables E.4-E.6).

## 7.1 INFANT AND CHILD MORTALITY

**Neonatal mortality:** The probability of dying within the first month of life.

**Postneonatal mortality:** The probability of dying between the first month of life and the first birthday (computed as the difference between infant and neonatal mortality).

**Infant mortality:** The probability of dying between birth and the first birthday.

**Child mortality:** The probability of dying between the first and fifth birthday.

**Under-five mortality:** The probability of dying between birth and the fifth birthday.

For the five-year period before the 2019-21 NFHS, the neonatal mortality rate was 25 deaths per 1,000 live births. This means that one in 40 live births died during the neonatal period. The infant mortality rate was 35 deaths per 1,000 live births. The under-five mortality rate was 42 deaths per 1,000 live births. The under-five mortality rate was 42 deaths per 1,000 live births (Table 7.1 and Figure 7.1). This indicates that one in 24 children in India die before their fifth birthday. More than four-fifths (83%) of these deaths occur during infancy.

**Trends:** The neonatal mortality rate declined from 49 deaths per 1,000 live births in the five years before the 1992-93 NFHS survey to 25 deaths per 1,000 live births in the five years before the 2019-21 NFHS survey. The neonatal mortality rates in the five years before the 1998-99 survey, 2005-06 survey, and the 2015-16 survey were 43, 39, and 30 deaths per 1,000 live births, respectively. The infant mortality rate declined from 79 deaths per 1,000 live births in the five years before the 1992-93 NFHS survey to 35 deaths per 1,000 live births in the five years before the 2019-21 NFHS survey. During the same period, the under-five mortality rate declined from 109 deaths per 1,000 live births to 42 deaths per 1,000 live births. The infant mortality rate decreased by 56 percent over a period of 28 years. The decline in the under-five mortality rate is slightly higher than the decline in the infant mortality rate during this period (a decrease of 62 percent).

**Figure 7.1 Trends in Early Childhood Mortality Rates**

*Deaths per 1,000 live births in the five-year period before the survey*

### Patterns by background characteristics

- The under-five mortality rate is higher in rural areas than in urban areas (46 deaths per 1,000 live births versus 32 deaths per 1,000 live births).
- The under-five mortality rate is highest in Uttar Pradesh (60 deaths per 1,000 live births) and lowest in Kerala and Puducherry (5 and 4 deaths per 1,000 live births, respectively) (Figure 7.2).
- The under-five mortality rate declines with an increase in mother's schooling (Table 7.2).
- The under-five mortality rate for scheduled tribes (50 deaths per 1,000 live births), scheduled castes (49 deaths per 1,000 live births), and other backward classes (41 deaths per 1,000 live births) are considerably higher than for

those who are not from scheduled castes, scheduled tribes, or other backward classes (33 deaths per 1,000 live births).

- The under-five mortality rate also declines with increasing household wealth. The under-five mortality rate declined from 59 deaths per 1,000 live births in the lowest wealth quintile to 20 deaths per 1,000 live births in the highest wealth quintile.

### Figure 7.2 Under-five Mortality Rate by State/UT

*Deaths per 1,000 live births for the five-year period before the survey*

## 7.2 BIODEMOGRAPHIC RISK FACTORS

Researchers have identified multiple risk factors for infant and child mortality based on the characteristics of the mother and child and the circumstances of the birth. **Table 7.3** and **Figure 7.3** illustrate the relationship between these risk factors and neonatal, infant, and under-five mortality.

- Boys are slightly more likely to die before their fifth birthday than girls. The gender gap is most pronounced in the neonatal period (within one month after birth).
- Shorter birth intervals are associated with higher under-five mortality. The under-five mortality rate for children born less than 2 years after the preceding birth is more than twice as high as that for children born 3 years after their preceding sibling.
- Children reported to be very small at the time of birth are more than four times as likely to die during the first month of life as children reported to be average size or larger (96 deaths per 1,000 live births versus 20 deaths per 1,000 live births).
- Children of birth order seven or more are more than twice as likely to die in the first five years of life than children of the first birth order (**Figure 7.3**).

### Figure 7.3 High-risk Births Have Higher Mortality Rates

Deaths in the first five years of life per 1,000 live births

## 7.3 PERINATAL MORTALITY

### Perinatal mortality rate

Perinatal deaths comprise stillbirths (pregnancy loss that occurs after seven months of gestation) and early neonatal deaths (deaths of live births within the first seven days of life). The perinatal mortality rate is calculated as the number of perinatal deaths per 1,000 pregnancies of seven or more months' duration.

**Sample:** Number of pregnancies of seven or more months' duration to women age 15-49 in the five years before the survey.

The causes of stillbirths and early neonatal deaths are closely linked, and it can be difficult to determine whether a death is one or the other. The perinatal mortality rate encompasses both stillbirths and early neonatal deaths, and it offers a better measure of the level of mortality and quality of service around delivery. During the five years before the survey, the perinatal mortality rate was 32 deaths per 1,000 pregnancies (**Table 7.5**).

### Patterns by background characteristics

- The perinatal mortality rate is higher in rural areas than in urban areas (34 deaths per 1,000 pregnancies versus 25 deaths per 1,000 pregnancies).
- The perinatal mortality rate is highest in Uttar Pradesh (44 deaths per 1,000 pregnancies), followed by Bihar (43 deaths per 1,000 pregnancies), and is lowest in Goa (2 deaths per 1,000 pregnancies).
- The perinatal mortality rate is twice as high among pregnancies to women in which the previous pregnancy interval was less than 15 months (50 deaths per 1,000 pregnancies) than those with an interval of 27 or more months.
- The perinatal mortality rate declines with an increase in the mother's schooling.
- The perinatal mortality rate also declines with higher household wealth. The perinatal mortality rate is 41 deaths per 1,000 pregnancies in the lowest wealth quintiles and 17 deaths per 1,000 pregnancies in the highest wealth quintile.

- **High-Risk Fertility Behaviour**

**High-risk fertility**

A birth is classified as high risk if it has one or more of the following characteristics: (i) mother's age is less than 18 years, (ii) mother's age is more than 34 years, (iii) previous birth interval in less than two years, and (iv) birth order is more than three.

**Sample:** Births in the 5 years preceding the survey.

- Twenty-nine percent of births in the last five years are in an avoidable risk category.
- Births which are in any avoidable high-risk category have almost twice the risk of dying as births that are not in any high-risk category.
- Five percent of the births and 13 percent of currently married women are in a multiple high-risk category.

## LIST OF TABLES

For more information on infant and child mortality, see the following tables:

Note: All estimates are for the 5 years preceding the survey (approximately 1988-1992 for NFHS-1, 1994-1998 for NFHS-2, 2001-2005 for NFHS-3, 2011-2015 for NFHS-4, and 2015-2019 for NFHS-5). Figures in parentheses are based on 250-499 unweighted person-years of exposure to the risk of death.

<sup>1</sup> Computed as the difference between the infant and neonatal mortality rates

Table 7.3 Early childhood mortality rates by demographic characteristics

Neonatal, postneonatal, infant, child, and under-five mortality rates for the 5-year period preceding the survey, by demographic characteristics and residence, India, 2019-21

| Demographic characteristic                 | Neonatal mortality (NN) | Postneonatal mortality <sup>1</sup> (PNN) | Infant mortality ( <sub>1</sub> q <sub>0</sub> ) | Child mortality ( <sub>4</sub> q <sub>1</sub> ) | Under-five mortality ( <sub>5</sub> q <sub>0</sub> ) |

Note: Figures in parentheses are based on 250-499 unweighted person-years of exposure to the risk of death. An asterisk indicates that a figure is based on fewer than 250 unweighted person-years of exposure to the risk of death, and the rate is not shown.

<sup>1</sup> Computed as the difference between the infant and neonatal mortality rates

<sup>2</sup> Excludes first-order births

Table 7.4 Early childhood mortality rates by state/union territory

Neonatal, postneonatal, infant, child, and under-five mortality rates for the 5-year period preceding the survey, by state/union territory, India, 2019-21

| State/union territory                | Neonatal mortality (NN) | Postneonatal mortality <sup>1</sup> (PNN) | Infant mortality (1q0) | Child mortality (4q1) | Under-five mortality (5q0) |

<sup>1</sup> Stillbirths are foetal deaths in pregnancies lasting 7 or more months

<sup>2</sup> Early neonatal deaths are deaths at age 0-6 days among live-born children

<sup>3</sup> The sum of the number of stillbirths and early neonatal deaths divided by the number of pregnancies of 7 or more months' duration, expressed per 1,000

<sup>4</sup> Categories correspond to birth intervals of <24 months, 24-35 months, 36-47 months, and 48 or over months

**Table 7.6 Perinatal mortality by state/union territory**

Perinatal mortality rates for the 5-year period preceding the survey, by state/union territory, India, 2019-21

| State/union territory                | Perinatal mortality rate |

| Telangana                            | 23.1                     |

Note: The perinatal mortality rate is the sum of the number of stillbirths and early neonatal deaths divided by the number of pregnancies of 7 or more months' duration, expressed per 1,000.

**Table 7.7 High-risk fertility behaviour**

Percent distribution of children born in the 5 years preceding the survey by category of elevated risk of mortality and the risk ratio, and percent distribution of currently married women by category of risk if they were to conceive a child at the time of the survey, India, 2019-21

Note: Risk ratio is the ratio of the proportion dead among births in a specific high-risk category to the proportion dead among births not in any high-risk category.

na = Not applicable

<sup>1</sup> Women are assigned to risk categories according to the status they would have at the birth of a child if they were to conceive at the time of the survey: current age less than 17 years and 3 months or greater than 34 years and 2 months, latest birth less than 15 months ago, or latest birth of order 3 or higher.

<sup>2</sup> Includes the category mother's age <18 and birth order >3

<sup>a</sup> Includes sterilized women

## Key Findings

- **Antenatal care (ANC):** The proportion of women age 15-49 in India who received ANC has risen from 84 percent in NFHS-4 (2015-16) to 94 percent in NFHS-5 (2019-2021), and 85 percent received ANC from a skilled provider in NFHS-5. Seventy percent of women had their first ANC visit during the first trimester and 59 percent had four or more ANC visits, an increase from 51 percent in 2015-16.
- **Components of antenatal care:** Pregnant women are more likely to have their weight measured (97%), their blood pressure measured (96%), and a blood sample taken (94%), than to take iron and folic acid (IFA) tablets for at least 100 days (44%) or to take an intestinal parasite drug (31%). A urine sample was taken for 94 percent of women and 67 percent of women had their abdomen examined.
- **Protection against neonatal tetanus:** Ninety-two percent of women's last live births were protected against neonatal tetanus.
- **Delivery:** Institutional deliveries have increased markedly from 39 percent in 2005-06 to 79 percent in 2015-16 and 89 percent in 2019-21.
- **C-sections:** The rate of C-section deliveries increased from 17 percent in 2015-16 to 22 percent in 2019-21. C-sections are particularly common in private sector health facilities (48% of deliveries).
- **Postnatal checks:** Eighty-two percent of newborns had a postnatal check within 2 days of birth. Seventy-three percent of newborns had their cord examined, while 76 percent had their temperature measured.

**H**ealth care services during pregnancy and childbirth and after delivery are important for the survival and well-being of both the mother and the infant. Antenatal care (ANC) can reduce the health risks for mothers and their babies by monitoring pregnancies and screening for complications. Delivery at a health facility, with skilled medical attention and hygienic conditions, reduces the risk of complications and infections during labour and delivery.

To improve the access to quality health care, especially for those residing in rural areas, the poor, women, and children, the government launched the National Rural Health Mission for the 2005-2012 period. One of the important goals of the National Rural Health Mission (NRHM) was to provide access to improved health care at the household level through female Accredited Social Health Activists (ASHAs), who act as an interface between the community and the public health system. The National Urban Health Mission (NUHM) was established as a Sub-mission of the over-arching National Health Mission (NHM) in 2013, with NRHM being the other Sub-mission of the National Health Mission.

At the same time, the RMNCH+A (reproductive, maternal, newborn, child, and adolescent health) approach was launched to address the major causes of mortality among women and children as well as the delays in accessing and utilizing health care and services. The RMNCH+A strategic approach was developed to provide an understanding of the ‘continuum of care’ to ensure an equal focus on various life stages.

This chapter presents information on ANC providers, the number and timing of ANC visits, and various components of maternal care. The chapter examines childbirth and postnatal care and presents information on the place of delivery, assistance during delivery, caesarean delivery, cost of delivery, and postnatal health checks for mothers and newborns.

## 8.1 PREGNANCY REGISTRATION

### 8.1.1 Registration of Pregnancies

Ninety-four percent of women age 15-49 who had a live birth in the five years before the survey registered the pregnancy for their most recent birth. Pregnancy registration is 90 percent or more for all groups, except for women age 35-49, women with no schooling, and births of order four or more (**Table 8.1**).

### 8.1.2 Mother and Child Protection Card (MCP Card)

The Mother and Child Protection Card (MCP Card) is a tool for informing and educating mothers and families on different aspects of maternal and child care and linking maternal and childcare into a continuum of care through the Integrated Child Development Services (ICDS) scheme of the Ministry of Women and Child Development and the National Rural Health Mission (NRHM) of the Ministry of Health and Family Welfare. The card also captures some of the key services delivered to mothers and babies during antenatal, delivery, and postnatal care for ensuring that the minimum package of services is delivered to the beneficiary. The card also serves as a tool for providing complete immunization to infants and children, early and exclusive breastfeeding, complementary feeding, and growth monitoring. Ninety-six percent of women age 15-49 who had a live birth in the five years before the survey and registered their last pregnancy received an MCP Card for that birth (**Table 8.1**). Differentials by background characteristics are generally quite small.

## 8.2 ANTENATAL CARE COVERAGE AND CONTENT

### 8.2.1 Skilled Providers

#### **Antenatal care (ANC) from a skilled provider**

Pregnancy care received from skilled providers, that is, doctors, auxiliary nurse midwives (ANMs), nurses, midwives, and lady health visitors.

**Sample:** Women age 15-49 who had a live birth in the five years before the survey

Eighty-five percent of women age 15-49 who had a live birth in the five years before the survey received antenatal care from a skilled provider at least once for their last birth (**Table 8.3**). The majority of women received antenatal care from doctors (63%), followed by auxiliary nurse midwives (ANMs), nurses, midwives, and lady health visitors (LHVs) (23%). **Table 8.4** shows that use of a skilled provider for ANC is low in Bihar (68%) and Nagaland (70%), and high in Goa, Kerala, and Lakshadweep (98% or more).

#### **Patterns by background characteristics**

- Use of a skilled provider for ANC services is higher in urban areas than rural areas (92% and 83%, respectively).
- Use of a skilled provider for ANC services increases with rising education. Seventy-three percent of women with no schooling obtained ANC services from a skilled provider, compared with 92 percent of women with 12 or more years of schooling.

- Women in the highest wealth quintile are much more likely to receive ANC from a skilled provider (94%) than those in the lowest quintile (72%).
- Women in the younger ages (below 20 years) are more likely to receive ANC from a skilled provider than women in the older age group 35-49 years (84% versus 80%).
- Similarly, women with a first birth are more likely to receive ANC from a skilled provider than women with a birth of order 6 and above (89% versus 67%).

### 8.2.2 Timing and Number of ANC Visits

More than half (59%) of women had at least four ANC visits during their last pregnancy, as recommended by WHO (**Table 8.5**). Six percent of women had no ANC visits. Urban women are more likely to have four or more ANC visits than rural women (69% and 55%, respectively).

Seventy percent of women had their first ANC visit during the first trimester 17 percent of women had their first ANC visit during the fourth and fifth month of pregnancy, and 7 percent first received ANC in the sixth month or later. The median number of months pregnant at the time of the first visit for all women with at least one ANC visit is 3.5 months.

The proportion of women who had at least four ANC visits during their last pregnancy is lowest in Nagaland (21%) and Bihar (25%) and highest in Goa (93%), Lakshadweep (92%), and Tamil Nadu (91%) (**Table 8.11**). Further, in 254 among 707 districts in India, over 70 percent of mothers who had their last birth in the five years preceding the survey had at least four ANC visits. On the other hand, there are a few districts, especially in Bihar and some states in the Northeastern region, that have less than 30 percent of mothers who received at least four ANC visits (**Map 8.1**).

**Figure 8.1 Trends in Antenatal Coverage**

*Percentage of women age 15-49*

**Trends:** The proportion of women that received the recommended four or more ANC visits increased from 51 percent in 2015-16 to 59 percent in 2019-2021 (**Figure 8.1**). Over the same time period, the proportion of women who received ANC in the first trimester increased from 59 percent to 70 percent.

**Map 8.1: Mothers who had at least 4 antenatal care visits, NFHS-5, 2019-21**

### 8.3 COMPONENTS OF ANC VISITS

In India, 67-97 percent of women who received ANC for their most recent live birth in the past five years had their weight measured, a blood sample taken, a urine sample taken, their abdomen examined, and their blood pressure measured (**Figure 8.2**). More than half of the women received information on specific pregnancy complications, namely convulsions (60%), vaginal bleeding (61%), prolonged labour (66%), high blood pressure (67%), and severe abdominal pain (68%). Four-fifths (80%) were told where they could go if they experienced pregnancy complications. Eighty-eight percent of women with a birth in the past five years were given or purchased iron and folic acid (IFA) tablets during the pregnancy for their most recent birth, but only 44 percent took the tablets for at least 100 days. Only 31 percent took an intestinal parasite drug during the pregnancy (**Table 8.7** and **Table 8.8**).

**Figure 8.2 Components of Antenatal Care**

*Among women who received ANC for their most recent birth, percentage who received selected services*

### 8.4 PROTECTION AGAINST NEONATAL TETANUS

#### Protection against neonatal tetanus

The number of tetanus toxoid injections needed to protect a baby from neonatal tetanus depends on the mother's vaccinations. A birth is protected against neonatal tetanus if the mother has received any of the following:

- Two tetanus toxoid injections during that pregnancy
- Two or more injections, the last one within three years of the birth
- Three or more injections, the last one within five years of the birth
- Four or more injections, the last one within ten years of the birth
- Five or more injections at any time prior to the birth

**Sample:** Last live births in the five years before the survey to women age 15-49

Neonatal tetanus, a major cause of early infant death in many developing countries, is often due to failure to observe hygienic procedures during delivery. **Table 8.7** shows that 92 percent of women's last births were protected against neonatal tetanus.

#### Patterns by background characteristics

- More than 9 in 10 women less than age 35 had their last birth protected against neonatal tetanus, compared with 90 percent of older women age 35-49.
- The percentage of women whose last birth was protected against neonatal tetanus increases with education, from 89 percent among women with no schooling to 93 percent among those with 12 or more years of schooling.
- Similarly, the percentage of women whose last birth was protected against neonatal tetanus increases with wealth quintiles, from 90 percent among women in households in the lowest wealth quintile to 94 percent among those in the highest wealth quintile.

## 8.5 ULTRASOUND TESTING DURING PREGNANCY

Seventy-eight percent of mothers had an ultrasound test during their pregnancies in last 5 years (**Table 8.12**).

**Trends:** Between 2015-16 and 2019-21, the proportion of pregnancies with an ultrasound test increased from 61 percent to 78 percent.

### Patterns by background characteristics

- Ultrasound tests are particularly common in urban areas, among women with 12 or more years of schooling, for Jain and Sikh women, and for women in households in the two highest wealth quintiles.
- Women with no sons are more likely than women with one or more sons to have an ultrasound test.
- Women with no sons who have an ultrasound test are much more likely to have the pregnancy end in the birth of a son than the birth of a daughter. For example, for women with no sons and three daughters who had an ultrasound test, 51 percent of their pregnancies resulted in the birth of a son and 37 percent resulted in the birth of a daughter. The results provide clear evidence of the existence and impact of son preference in India.

## 8.6 DELIVERY SERVICES

### 8.6.1 Institutional Deliveries

#### Institutional deliveries

Deliveries that occur in a health facility.

**Sample:** All live births in the five years before the survey

Increasing institutional deliveries is an important factor in reducing maternal and neonatal mortality. Eighty-nine percent of live births in the five years before the survey were delivered in a health facility (**Table 8.13**). The most common reason for not delivering in a health facility was that the woman did not think it was necessary (28%), but 19 percent said that the husband or family did not allow them to have the delivery in a health facility, 17 percent of women said that a health facility was too far or there was no transportation, and 15 percent said it costs too much (**Table 8.14**).

**Trends:** Institutional deliveries increased between 2015-16 and 2019-21, from 79 percent to 89 percent (**Figure 8.3**).

**Figure 8.3 Trends in Health Facility Births**

*Percentage of births in the five years before the survey*

Patterns by background characteristics

- Higher-order births are much less likely to be institutional deliveries; only 64 percent of sixth or higher order births occurred at a health facility, compared with 94 percent of first births.
- Antenatal care increases the likelihood of an institutional delivery. Ninety-four percent of births to mothers who had four or more ANC visits were delivered in a health facility, compared with 70 percent of births to mothers who had no ANC visits.
- Ninety-four percent of births to urban women were delivered in a health facility, compared with 87 percent of births to rural women.
- The mother’s educational status is highly correlated with the place of delivery. Ninety-seven percent of births to mothers with 12 or more year of schooling were delivered in a health facility, compared with 75 percent of births to mothers with no schooling (**Figure 8.4**).
- Similarly, 97 percent of births to mothers in households in the highest wealth quintile were delivered in a health facility, compared with 76 percent of births to mothers in households in the lowest wealth quintile.
- Almost 100 percent of births in Puducherry, Goa, Kerala, Lakshadweep, and Tamil Nadu were delivered in a health facility. Ninety-five percent of births or more were delivered in health facilities in 16 states and union territories. At the other end of the spectrum, less than half (46%) of the births in Nagaland and 58 percent of the births in Meghalaya were delivered in health facilities (**Figure 8.5**).

### Figure 8.5 Health Facility Births by State/UT

Percentage of live births in the five years before the survey

#### 8.6.2 Skilled Assistance during Delivery

##### Skilled assistance during delivery

Births delivered with the assistance of doctors, auxiliary nurse midwives, nurses, midwives, and lady health visitors.

**Sample:** All live births in the five years before the survey

Assistance during childbirth can influence the birth outcome and the health of the mother and the newborn. A skilled attendant can manage complications of pregnancy and delivery or refer the mother and/or the baby to the next level of care. In the five years before the survey, almost 9 in 10 live births (89%) were delivered by a skilled provider (**Table 8.19**). The majority of births were attended by doctors (62%), followed by ANMs, nurses, midwives, and LHV's (27%), and *dais* (TBAs) (6%) (**Figure 8.6**).

**Trends:** Skilled assistance during deliveries in India has increased substantially; the proportion of births assisted by a skilled provider increased from 81 percent in 2015-16 to 89 percent in 2019-21.

## Patterns by background characteristics

- Ninety-five percent of births to mothers who had four or more ANC visits were delivered by a skilled attendant, compared with 72 percent of births to mothers with no ANC visits.
- Only 28 percent of births that took place at the woman's own home were delivered by a skilled provider.
- Births to women in urban areas (94%) are more likely to be delivered by a skilled provider than births to women in rural areas (88%).
- The mothers' educational status is highly correlated with skilled delivery. Ninety-six percent of births to mothers with 12 or more years of schooling were delivered by a skilled attendant, compared with 78 percent of births to mothers with no schooling.
- Skilled birth attendance increases from 79 percent of women in the lowest wealth quintile to 97 percent of women in the highest wealth quintile (**Figure 8.7**).

**Figure 8.6 Assistance during Delivery**

*Percent distribution of births in the five years before the survey*

**Figure 8.7 Skilled Assistance at Delivery by Household Wealth**

*Percentage of live births in the five years before the survey*

### 8.6.3 Delivery by Caesarean Section

Access to caesarean section (C-section) can reduce maternal and neonatal mortality and complications such as obstetric fistula. However, a caesarean section without a medical need can put a woman at risk of short and long-term health problems. WHO advises that caesarean sections should only be done when medically necessary, and does not recommend a target rate for countries to achieve at the population level.

The 2019-21 NFHS found that 22 percent of live births in the five years before the survey were delivered by caesarean section. Nine percent of the C-sections were decided on after the onset of labour pains, compared with 12 percent that were decided on before the onset of labour pains (**Table 8.19**).

**Trends:** Since 2015-16, the rate of C-sections has increased, from 17 percent to 22 percent in 2019-21.

#### **Patterns by background characteristics**

- Caesarean deliveries are more common among first births (28%) than higher-order births (ranging from 4% to 20%).
- C-sections are particularly common in private sector health facilities (48% of deliveries), an increase from 41 percent in 2015-16.
- The caesarean delivery rate is higher in urban than rural areas (32% against 18%).
- More educated women are much more likely to undergo caesarean deliveries. The caesarean rate for deliveries for women with 12 or more years of schooling is 35 percent, compared with 27 percent for women with 10-11 years of schooling, 19 percent for women with 8-9 years of schooling, and 8 percent for women with no schooling.

There is strong positive relationship between wealth quintiles and delivery by C-section. Mothers in households in the highest wealth quintile are much more likely to deliver through C-section (39%) than mothers in households in the lowest wealth quintile (7%) (**Table 8.19**). It is noticeable that a majority of districts in India have over 30 percent of births delivered in private health facilities that were conducted through C-section (**Map 8.2**).

**Map 8.2: Births in a private health facility that were delivered by caesarean section, NFHS-5, 2019-21**

## 8.7 DELIVERY COSTS

The average out-of-pocket cost paid for delivery for the most recent live birth among women age 15-49 who had a live birth in the five years preceding the survey that was delivered in a health facility was Rs. 10,035 (**Table 8.20**). The average cost was almost eight times as high in private health facilities (Rs. 24,663) as in public health facilities (Rs. 3,245).

## 8.8 POSTNATAL CARE

Among women age 15-49 giving birth in the five years before the survey with their most recent live birth in a health facility, 90 percent of women delivering through C-section in a private health facility stayed for 3 or more days after the delivery. Eighty-eight percent of women delivering through C-section in a health facility stayed for 3 or more days after the delivery (**Table 8.21**).

### 8.8.1 Postnatal Health Check for Mothers

A large proportion of maternal and neonatal deaths occur during the first 24 hours after delivery. For both the mother and the infant, prompt postnatal care is important to treat complications that arise from delivery and to provide the mother with important information on caring for herself and her baby. The Ministry of Health and Family Welfare (MoHFW) recommends that all women who deliver in a health facility receive a postnatal health check within the first 24 hours after delivery and that women giving birth outside of a health facility should be referred to a health facility for a postnatal check within 12 hours after giving birth.

The 2019-21 NFHS found that among women age 15-49 giving birth in the five years before the survey, 61 percent had a postnatal check during the first two days after birth. Sixteen percent of mothers did not receive any postnatal checks (**Table 8.22**).

**Trends:** The proportion of mothers who received a postnatal check in the first two days after birth decreased from 65 percent to 61 percent between 2015-16 and 2019-21.

#### Patterns by background characteristics

- Women who delivered in a health facility were more likely to receive a postnatal health check within two days of delivery than those who delivered elsewhere (**Figure 8.8**).
- Sixty-two percent of urban women and 61 percent of rural women received a postnatal check within two days.

**Figure 8.8 Postnatal Care by Place of Delivery**

*Percentage of last births in the five years before the survey for which women and newborns received a postnatal check during the first two days after birth*

- Women with 12 or more years of schooling (62%) are more likely than women with no schooling (59%) to have a postnatal check within two days.

- Women from the wealthiest households (63%) are more likely to receive a postnatal check within two days than women from the lowest wealth quintile (58%).
- Mothers were most likely to receive a postnatal check within two days of delivery in Goa (95%), Puducherry, Lakshadweep, Tamil Nadu, Odisha, Haryana, and Kerala (93% each), and least likely to receive a postnatal check within two days in Nagaland (48%), Meghalaya (56%), Arunachal Pradesh (59%), and Bihar (64%).

The skills of the provider are an important factor in determining the provider's ability to diagnose problems and recommend appropriate treatment or referral. In India, less than half (43%) of the women received their first postnatal check from a doctor; 26 percent received a postnatal check from an ANM, nurse, midwife, or LHV, and 12 percent from an ASHA. Only 2 percent of women received a check from a *dai* (TBA) (**Table 8.23**).

### 8.8.2 Postnatal Health Checks for Newborns

The first 48 hours of life are a critical phase in the lives of newborn babies and a period in which many neonatal deaths occur. Lack of postnatal health checks during this period can delay the identification of newborn complications and the initiation of appropriate care and treatment.

In India, 82 percent of newborns in the last five years had a first postnatal check within the first 2 days after birth (**Table 8.24**). Fourteen percent of newborns did not receive any postnatal health check.

#### Patterns by background characteristics

- Newborns delivered in a health facility were substantially more likely to receive a postnatal health check within two days of birth than those delivered elsewhere, particularly at their own home/parent's home.
- There is a substantial variation in the proportion of newborns with a postnatal check in the first 2 days after birth by the mother's level of education. Eighty-eight percent of babies born to mothers with 12 or more years of schooling received a postnatal check within two days, compared with 77 percent of babies born to mothers with less than 5 years of schooling and 69 percent of babies born to mothers with no schooling.

Fifteen percent of newborns received their first postnatal check from a doctor, while 11 percent received their first postnatal check from an ANM, nurse, midwife, or LHV (**Table 8.25**).

Seventy-three percent of newborns had their cord examined, while 76 percent had their temperature measured. Among women age 15-49 with a live birth in the five years preceding the survey, 73 percent were counselled on the danger signs for newborns, 81 percent were counselled on breastfeeding, while 77 percent were observed breastfeeding the baby (**Table 8.26**).

A summary of symptoms of postpartum complications for all pregnancies in the five years before the survey is presented in **Table 8.27**.

## LIST OF TABLES

For more information on maternal health, see the following tables:

| Tables     |                                                                                             |

Note: If more than one source of ANC was mentioned, only the provider with the highest qualification is considered in this table.

ANM = Auxiliary nurse midwife; LHV = Lady health visitor; TBA = Traditional birth attendant; ICDS = Integrated Child Development Services; ASHA = Accredited Social Health Activist

<sup>1</sup> Skilled provider includes doctor, auxiliary nurse midwife, nurse, midwife, and lady health visitor

Table 8.4 Antenatal care by state/union territory

Percent distribution of women age 15-49 who had a live birth in the 5 years preceding the survey by antenatal care (ANC) provider during pregnancy for the most recent live birth and percentage receiving ANC from a skilled provider, according to state/union territory, India, 2019-21

Note: If more than one source of ANC was mentioned, only the provider with the highest qualification is considered.

ANM = Auxiliary nurse midwife; LHV = Lady health visitor; TBA = Traditional birth attendant; ICDS = Integrated Child Development Services; ASHA = Accredited Social Health Activist

<sup>1</sup> Skilled provider includes doctor, auxiliary nurse midwife, nurse, midwife, and lady health visitor

**Table 8.5 Number of antenatal care visits and timing of first visit**

Percent distribution of women age 15-49 who had a live birth in the 5 years preceding the survey by number of antenatal care (ANC) visits for the most recent live birth, and by the timing of the first visit, and among women with ANC, median months pregnant at first visit, according to residence, India, 2019-21

| Number and timing of ANC visits                             | Urban  | Rural   | Total   |
|-------------------------------------------------------------|--------|---------|---------|

Table 8.9 Male involvement in antenatal care

Among men age 15-49 whose youngest living child was age 0-35 months, percentage for whom the mother of the child received antenatal care (ANC) and the father was present or not present at the time of any ANC visit, percentage who were told by a health provider or worker at any time during the pregnancy about specific signs of pregnancy complications, and percentage who were told what to do if the child's mother had any pregnancy complication, according to background characteristics, India, 2019-21

| Background characteristic                    | Percentage for whom the child's mother received ANC and the father was: |                         |       | Percentage who were told by a health provider or worker about specific signs of pregnancy complications |             |                  |                | Percentage ever told what to do if child's mother had any pregnancy complication |      | Number of men |

Table 8.9 Male involvement in antenatal care—Continued

Among men age 15–49 whose youngest living child was age 0–35 months, percentage for whom the mother of the child received antenatal care (ANC) and the father was present or not present at the time of any ANC visit, percentage who were told by a health provider or worker at any time during the pregnancy about specific signs of pregnancy complications, and percentage who were told what to do if the child's mother had any pregnancy complication, according to background characteristics, India, 2019–21

| Background characteristic | Percentage for whom the child's mother received ANC and the father was: |                         |       | Percentage who were told by a health provider or worker about specific signs of pregnancy complications |             |                  |                       | Percentage ever told what to do if child's mother had any pregnancy complication |      | Number of men |

**Table 8.10 Reasons why child's mother did not receive antenatal care: Men**

Percent distribution of men age 15-49 whose youngest living child was age 0-35 months and the child's mother did not receive antenatal care when pregnant with the child by the main reason for not receiving antenatal care, according to residence, India, 2019-21

| Reason why the child's mother did not receive antenatal care | Urban | Rural | Total |
|--------------------------------------------------------------|-------|-------|-------|
| Man did not think it was necessary/did not allow             | 20.1  | 14.2  | 15.3  |
| Family did not think it was necessary/did not allow          | 15.3  | 12.1  | 12.7  |
| Child's mother did not want check-up                         | 3.0   | 4.1   | 3.9   |
| Has had children before                                      | 7.9   | 1.7   | 2.9   |
| Costs too much                                               | 19.4  | 29.6  | 27.7  |
| Too far/no transportation                                    | 0.3   | 2.7   | 2.2   |
| No female health worker available                            | 1.1   | 2.7   | 2.4   |
| Other                                                        | 3.4   | 4.4   | 4.2   |
| Don't know/missing                                           | 29.4  | 28.5  | 28.7  |
| Total                                                        | 100.0 | 100.0 | 100.0 |
| Number of men                                                | 112   | 485   | 597   |

Table 8.11 Antenatal care indicators by state/union territory

Among women age 15-49 with a live birth in the 5 years preceding the survey, percentage who received different types of antenatal care (ANC) during the pregnancy for their most recent live birth by state/union territory, India, 2019-21

| State/union territory                | Percentage who had at least one ANC visit | Percentage who had four or more ANC visits | Percentage with an ANC visit in the first trimester of pregnancy | Percentage who received information from a health worker about pregnancy complications <sup>1</sup> | Percentage who received two or more TT injections during the pregnancy | Percentage whose last birth was protected against neonatal tetanus <sup>2</sup> | Percentage who were given or bought IFA | Percentage who took IFA for at least 100 days | Percentage who took IFA for at least 180 days | Percentage who took an intestinal parasite drug |

TT = Tetanus toxoid; IFA = Iron and folic acid

<sup>1</sup> Vaginal bleeding, convulsions, prolonged labour, severe abdominal pain, high blood pressure, or where to go if she had pregnancy complications

<sup>2</sup> Includes mothers with two injections during the pregnancy for her last birth, or two or more injections (the last within 3 years of the last live birth), or three or more injections (the last within 5 years of the last birth), or four or more injections (the last within 10 years of the last live birth), or five or more injections at any time prior to the last birth

Table 8.12 Pregnancies for which an ultrasound test was done

Percentage of all pregnancies to women age 15-49 in the 5 years preceding the survey for which an ultrasound test was done and percent distribution of pregnancies with an ultrasound test by pregnancy outcome, according to background characteristics, India, 2019-21

| Background characteristic          | Percentage of pregnancies with an ultrasound test | Number of pregnancies | Pregnancy outcome <sup>1</sup> |          |             |                | Total | Number of pregnancies with an ultrasound test |

Note: Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Men whose youngest living child age 0-35 months was not delivered in a health facility

**Table 8.18 Adherence to delivery protocol for home delivery**

Percentage of women age 15-49 who had a live birth delivered at home in the 5 years preceding the survey by whether the recommended protocol was followed at the time of delivery for the most recent live birth delivered at home, according to residence, India, 2019-21

| Protocol at delivery                                                 | Urban | Rural  | Total  |
|----------------------------------------------------------------------|-------|--------|--------|
| Disposable delivery kit (DDK) used                                   | 56.0  | 50.5   | 51.3   |
| Clean blade used to cut the cord                                     | 92.2  | 92.7   | 92.6   |
| Either of the above                                                  | 93.8  | 93.6   | 93.6   |
| Baby was immediately wiped dry and then wrapped without being bathed | 88.5  | 88.7   | 88.6   |
| Number of women                                                      | 2,508 | 14,507 | 17,016 |

Table 8.19 Assistance during delivery

Percent distribution of live births to women age 15-49 in the 5 years preceding the survey by person providing assistance during delivery, percentage delivered by caesarean section (C-section), percentage delivered by C-section that was planned before the onset of labour pains, and percentage delivered by C-section that was decided after the onset of labour pains, according to background characteristics, India, 2019-21

| Background characteristic | Person providing assistance during delivery |                          |                        |           |                    |       |        | Timing of decision to conduct a C-section |                                                         |                                                              |                                           |                              | Number of births |                             |  |
|---------------------------|---------------------------------------------|--------------------------|------------------------|-----------|--------------------|-------|--------|-------------------------------------------|---------------------------------------------------------|--------------------------------------------------------------|-------------------------------------------|------------------------------|------------------|-----------------------------|--|

Table 8.19 Assistance during delivery—Continued

Percent distribution of live births to women age 15-49 in the 5 years preceding the survey by person providing assistance during delivery, percentage delivered by caesarean section (C-section), percentage delivered by C-section that was planned before the onset of labour pains, and percentage delivered by C-section that was decided after the onset of labour pains, according to background characteristics, India, 2019-21

| Background characteristic          | Person providing assistance during delivery |                          |                        |           |                    |       |        | Timing of decision to conduct a C-section |                                                         |                                                              |                                           |                              |                             |                  |

Note: If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this tabulation.

ANM = Auxiliary nurse midwife; LHV = Lady health visitor; TBA = Traditional birth attendant; NGO = Nongovernmental organization

<sup>1</sup> Skilled provider includes doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, and other health personnel

<sup>2</sup> Includes only the most recent birth in the 5 years preceding the survey

<sup>3</sup> Includes missing

Table 8.20 Delivery costs

The average out-of-pocket cost paid for delivery for the most recent live birth among women age 15-49 who had a live birth in the 5 years preceding the survey that was delivered in a health facility, according to background characteristics, India, 2019-21

| Background characteristic    | Average cost (Rs.) <sup>1</sup> |                         |                     | Number of births in a health facility |
|------------------------------|---------------------------------|-------------------------|---------------------|---------------------------------------|

Note: Postnatal health checks are checks on the newborn's health within 42 days of the birth.

ANM = Auxiliary nurse midwife; LHV = Lady health visitor; TBA = Traditional birth attendant; ASHA = Accredited Social Health Activist; NGO = Nongovernmental organization

<sup>1</sup> Includes missing

Table 8.26 Components of postnatal health check

Among women age 15-49 with a live birth in the 5 years preceding the survey, components of postnatal care for the most recent birth from a healthcare provider in the 2 days after birth, by background characteristics, India, 2019-21

| Background characteristic    | Percentage whose cord was examined | Percentage whose temperature was measured | Percentage who were counselled on danger signs for newborns | Percentage who were counselled on breastfeeding | Percentage who were observed breastfeeding the baby | Number of births |
