Note: Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

nc = No cases

<sup>1</sup> Means are calculated excluding respondents who gave non-numeric responses; <sup>2</sup> Includes women who are married, but whose *gauna* has not been performed. If women who are married, but whose *gauna* has not been performed, report having sex with their husband, the sex is not considered higher risk; <sup>3</sup> Visits to parental/in-laws' home excluded

Table 13.10.2 Multiple sexual partners and higher-risk sexual intercourse in the past 12 months: Men

Among all men age 15-49 who had sexual intercourse in the past 12 months, percentage who had sexual intercourse with more than one sexual partner in the past 12 months, and percentage who had intercourse in the past 12 months with a person who was neither their wife nor lived with them; among those having more than one partner in the past 12 months, percentage reporting that a condom was used during last intercourse; among men age 15-49 who had sexual intercourse in the past 12 months with a person who was neither their wife nor lived with them, percentage who used a condom during last sexual intercourse with such a partner; and among men who ever had sexual intercourse, mean number of sexual partners during their lifetime, according to background characteristics, according to background characteristics, India, 2019-21

| Background characteristic                                                             | All men                                                     |                                                                                                                   |                                                                                                                   | Men who had 2 or more partners in the past 12 months                  |               | Men who had intercourse in the past 12 months with a person who was neither their wife nor lived with them |               | Men who ever had sexual intercourse <sup>1</sup> |               |

Note: Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

nc = No cases

<sup>1</sup> Means are calculated excluding respondents who gave non-numeric responses;

<sup>2</sup> Includes men who are married, but whose *gauna* has not been performed. If men who are married, but whose *gauna* has not been performed, report having sex with their wife, the sex is not considered higher risk

Table 13.11 Multiple sexual partners and higher-risk sexual intercourse in the past 12 months by state/union territory

Among all women and men age 15-49, percentage who had sexual intercourse with more than one sexual partner in the past 12 months, and percentage who had intercourse in the past 12 months with a person who was neither their husband nor lived with them; among those having more than one partner in the past 12 months, percentage reporting that a condom was used during last intercourse; among women and men age 15-49 who had sexual intercourse in the past 12 months with a person who was neither their husband nor lived with them, percentage who used a condom during last sexual intercourse with such a partner; and among women and men who ever had sexual intercourse, mean number of sexual partners during their lifetime, according to state/union territory, India, 2019-21

| State/union territory | All women                                                                                                            |                                                                                        |                                                                       |                                            | All men                                                                                                           |                                                                       |                                            |                                                                       | Men who ever had sexual intercourse <sup>1</sup>                                          |                                                                       |                                                                       |                                            |

Note: Total includes Jain women, who are not shown separately.

<sup>1</sup> In this context, "pretest counselling" means that someone talked with the respondent about all three of the following topics: 1) babies getting HIV from their mother, 2) preventing the virus, and 3) getting tested for the virus

<sup>2</sup> Women are asked whether they received an HIV test during labour only if they gave birth in a health facility

<sup>3</sup> Denominator for percentages includes women who did not receive antenatal care for their last birth in the past 2 years.

Table 13.16 Coverage of prior HIV testing during antenatal care (ANC) or labour by state/union territory

Among women age 15-49 who gave birth in the 2 years preceding the survey, percentage who received HIV counselling during ANC, percentage who received an HIV test during ANC for their most recent birth by whether they received their results and post-test counselling, and percentage who received an HIV test during ANC or labour for their most recent birth by whether they received their test results, according to state/union territory, India, 2019-21

| State/union territory                | Percentage who received counselling on HIV during antenatal care <sup>1</sup> | Percentage who were tested for HIV during antenatal care and who: |                                                            |                         | Percentage who received counselling on HIV and an HIV test during ANC, and received the results | Percentage who had an HIV test during ANC or delivery and who <sup>2</sup> : |                         |

Note: Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> In this context, "pretest counselling" means that someone talked with the respondent about all three of the following topics: 1) babies getting HIV from their mother, 2) preventing the virus, and 3) getting tested for the virus

<sup>2</sup> Women are asked whether they received an HIV test during labour only if they gave birth in a health facility

**Table 13.17 Self-reported prevalence of sexually transmitted infection (STI) and/or STI symptoms**

Among women and men age 15-49 who have ever had sexual intercourse, percentage reporting having an STI in the 12 months preceding the survey, by background characteristics, India, 2019-21

| Background characteristic                                                             | Percentage of women who report that in the past 12 months they had: |                                            |                         |                                          |                                                 | Percentage of men who report that in the past 12 months they had: |                                      |                         |                                                          |        | Number of men who ever had sexual intercourse |

Note: Figures in parentheses are based on 25-49 unweighted cases.

<sup>1</sup> Respondents who, when asked prompted questions, say that HIV/AIDS cannot be transmitted by mosquito bites and by sharing food with a person who has HIV/AIDS, and who say that use of a condom for every act of sexual intercourse and having just one uninfected faithful sex partner can reduce the chance of getting HIV/AIDS

<sup>2</sup> Respondents with a comprehensive knowledge say that use of a condom for every act of sexual intercourse and having just one uninfected faithful sex partner can reduce the chance of getting HIV/AIDS, say that a healthy-looking person can have HIV/AIDS, and reject two common misconceptions about HIV/AIDS transmission or prevention

<sup>3</sup> Men who used a condom in the 12 months preceding the survey are assumed to know a condom source

<sup>4</sup> For women, visits to parental/in-laws' home excluded

**Table 13.20 Comprehensive knowledge about HIV/AIDS and knowledge of a source of condoms among youth by state/union territory**

Percentage of women and men age 15-24 with a comprehensive knowledge about HIV/AIDS and percentage with knowledge of a source of condoms, by state/union territory, India, 2019-21

| State/union territory                | Women age 15-24                                                                               |                                                                    |                                     | Men age 15-24                                                                                 |                                                                    |                                                  |

Note: Figures in parentheses are based on 25-49 unweighted cases.

<sup>1</sup> Respondents who, when asked prompted questions, say that HIV/AIDS cannot be transmitted by mosquito bites and by sharing food with a person who has HIV/AIDS, and who say that use of a condom for every act of sexual intercourse and having just one uninfected faithful sex partner can reduce the chance of getting HIV/AIDS

<sup>2</sup> Respondents with a comprehensive knowledge say that use of a condom for every act of sexual intercourse and having just one uninfected faithful sex partner can reduce the chance of getting HIV/AIDS, say that a healthy-looking person can have HIV/AIDS, and reject two common misconceptions about HIV/AIDS transmission or prevention

<sup>3</sup> Men who used a condom in the 12 months preceding the survey are assumed to know a condom source

Table 13.21 Age at first sexual intercourse among youth

Percentage of women and men age 15-24 who have ever had sexual intercourse and who had sexual intercourse before age 15, by background characteristics, India, 2019-21

| Background characteristic                                                             | Women                                           |                                                     |                 | Men                                             |                                                     |               |

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. Total includes Jain women, who are not shown separately.

nc = No cases

<sup>1</sup> Sexual intercourse with a sex partner who was neither a spouse nor who lived with the respondent

<sup>2</sup> Includes women/men who are married, but whose *gauna* has not been performed. If women/men who are married, but whose *gauna* has not been performed, report having sex with their spouses, the sex is not considered higher risk.

<sup>3</sup> For women, visits to parental/in-laws' home excluded.

Table 13.24 Recent HIV tests among youth

Among women and men age 15-24 who have had sexual intercourse in the past 12 months, percentage who have had an HIV test in the 12 months preceding the survey and received the results of the last test, by background characteristics, India, 2019-21

| Background characteristic                                                             | Women                                                                              |                 | Men                                                                                |               |

Note: An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed. Total includes women and men belonging to Jain religion, who are not shown separately.

<sup>1</sup> Includes women/men who are married, but whose *gauna* has not been performed. If women/men who are married, but whose *gauna* has not been performed, report having sex with their husband, the sex is not considered higher risk.

<sup>2</sup> For women, visits to parental/in-laws' home excluded

### Key Findings

- **Employment of currently married women and men:** Thirty-two percent of currently married women age 15-49, and 98 percent of currently married men age 15-49 are employed. Among employed women, 83 percent earn cash and 15 percent are not paid at all. More than four-fifths of employed women (85%) participate in decisions about the use of their own earnings.
- **Access to a bank account and mobile phone:** Seventy-nine percent of women have a bank or savings account that they themselves use, and 54 percent of women have a mobile phone that they themselves use. Seventy-one percent of women who have a mobile phone can read text messages.
- **Participation in decision making:** Seventy-one percent of currently married women participate in making decisions about their own health care, major household purchases, and visits to their own family or relatives alone or jointly with their husband, while 11 percent do not participate in any of the three decisions. Women's participation in decision making has increased since NFHS-4.
- **Attitudes toward wife beating:** Forty-five percent of women and 44 percent of men agree with one or more of seven specified reasons for wife beating. Agreement with one or more reasons for wife beating has fallen for women since NFHS-4 but has slightly increased for men.
- **Asset ownership:** Forty-two percent of women and 60 percent of men own a house alone or jointly with someone, and 32 percent of women and 42 percent of men own land alone or jointly with someone.

This chapter explores women's empowerment in terms of employment, earnings, control over earnings, magnitude of women's earnings relative to those of their husbands, decision making, empowering attitudes, house and land ownership, and access and use of a bank account and mobile phone. While the focus of this chapter is women, data for specific indicators are also presented for men. Comparisons of indicators for women and men help to identify gender disparities and provide context for women's empowerment. Questions on women's empowerment were implemented only in the subsample of NFHS-4 households selected for the state module.

## 14.1 CURRENTLY MARRIED WOMEN'S AND MEN'S EMPLOYMENT

### Employment

Respondents are considered to be employed if they have done any work other than their housework in the 12 months before the survey.

**Sample:** Currently married women and men age 15-49

### Earning cash for employment

Respondents are asked if they are paid for their labour in cash or in kind. Only those who receive payment in cash only or in cash and in kind are considered to earn cash for their employment.

**Sample:** Currently married women and men age 15-49 employed in the 12 months before the survey

In India, only 32 percent of currently married women age 15-49 are employed, compared with 98 percent of currently married men age 15-49. Among employed women, 83 percent earn cash, including 8 percent whose earnings are in both cash and in kind. Fifteen percent of employed women are not paid for the work they do. By comparison, 95 percent of employed men earn cash, and 4 percent do not receive any payment for their work (**Table 14.1**).

**Trends:** Employment among currently married women age 15-49 has marginally increased from 31 percent in NFHS-4 to the current 32 percent. Among the employed, the percentage of women who earn cash has increased from 80 percent to 83 percent. For men, by contrast there has been no change in the percentage employed and the percentage who earn cash has slightly increased from 91 percent to 95 percent.

### Patterns by background characteristics

- Employment among currently married women generally increases with age, from 14 percent among women age 15-19 to 40 percent among women age 40-44, but it falls to 37 percent in the oldest age group (**Figure 14.1**).

**Figure 14.1 Employment by Age**

*Percentage of currently married women and men age 15-49*

- Employment among currently married men increases from 87 percent among men age 15-19 to 97-98 percent among men age 25 and older.
- Among employed women, the percentage not paid at all for the work they do is highest (22%) among women age 15-19, but it declines to 13-17 percent among women age 25 and above.

- Employment among currently married women varies greatly by state, ranging from 13 percent among women in Lakshadweep and 19 percent in Bihar, to as high as 55 percent in Meghalaya and 54 percent each in Chhattisgarh and Manipur (**Table 14.2**).

## 14.2 CONTROL OVER WOMEN'S EARNINGS

### Control over one's own cash earnings (women)

Respondents are considered to have control over their own earnings if they participate in decisions alone or jointly with their husband about how their earnings will be used.

**Sample:** Currently married women age 15-49 who received cash earnings for employment during the 12 months preceding the survey

Eighty-five percent of currently married women who earn cash say that they make decisions alone or jointly with their husband on how their cash earnings are used. It is most common for women to make these decisions jointly with their husband; only 18 percent mainly make these decisions alone. For 14 percent of women, the husband is the sole decision maker regarding the use of women's earnings (**Table 14.3.1** and **Figure 14.2**). Men whose wives' earned cash were also asked about decision making regarding their wife's earnings. A similar proportion (85%) of men with wives who earn cash, as married women who earn cash, report that decisions about the wife's earnings are made either by the wife or jointly with them (**Table 14.3.2**).

Forty percent of currently married women who earn cash and have husbands with cash earnings say that they earn more or about the same as their husbands. A higher proportion (47%) of men who earn cash and whose wives earn cash report that their wife earns about the same or more than them (**Table 14.5**).

**Trends:** Women's participation in decisions about their own earnings has slightly increased (from 82% to 85%) in the 4 years since NFHS-4. However, the percentage of employed women who earn cash and who earn about the same or more than their husband has slightly decreased from 42 percent at the time of NFHS-4 to 40 percent in NFHS-5 (**Table 14.3.1**).

### Patterns by background characteristics

- Women's control over their own earnings increases with age from 71 percent of women age 15-19 participating in decisions about the use of their own earnings to 86 percent among women age 40-49 (**Table 14.3.1**).
- Women's control over their own earnings increases only a little with schooling and wealth and is higher in urban than rural areas.
- There is little variation by background characteristics in the proportion of women who earn about the same or more than their husbands. Notably, however, less than half (46%) of employed women with 12 or more years of schooling earn about the same or more than their husbands.
- At least 7 out of 10 currently married women with cash earnings have a say in how their earnings are used in every state and union territory.

**Figure 14.2 Control Over Women's Earnings**

*Percent distribution of currently married women with cash earnings in the 12 months before the survey by the person who usually makes decisions about their use*

- The percentage of women who earn about the same or more than their husband varies greatly by state, from a low of 19 percent in Himachal Pradesh to 53 percent in Gujarat (**Table 14.5**).

### 14.3 CONTROL OVER MEN'S EARNINGS

#### **Control over one's own cash earnings (men)**

Respondents are considered to have control over their own earnings if they participate in decisions alone or jointly with their wives about how their own earnings will be used.

**Sample:** Currently married men age 15-49 who received cash earnings for employment during the 12 months preceding the survey

Currently married women whose husbands had cash earnings and currently married men who had cash earnings were asked who usually makes decisions about the use of the husband's earnings. Women and men give slightly different answers: 6 percent each say that it is the wife who mainly decides, 71 percent women and 66 percent men say that the decision is made jointly, and 21 percent women and 28 percent men say that the husband mainly makes the decision. Decision making about the use of husband's earnings does not vary much by most background characteristics, although it is notable that joint decision making is more common among older couples than couples age 15-19 (**Table 14.4**).

**Trends:** Control over men's earnings, based on women's responses, has increased by 7 percentage points between NFHS-4 and NFHS-5. In NFHS-4, 64 percent of women whose husbands had earnings said that they made decisions jointly with their husband about the use of his earnings, compared with 71 percent in NFHS-5. Based on responses by men with earnings too, joint decision making about husband's earnings has increased by 1 percent from NFHS-4 (65% to 66%), but decision making by the wife alone has decreased to 6 percent in NFHS-5 from 8 percent in NFHS-4 (**Table 14.4**).

### 14.4 PARTICIPATION IN HOUSEHOLD DECISION MAKING

#### **Participation in common household decisions**

Women are considered to participate in household decisions if they make decisions alone or jointly with their husband in all three of the following areas: (1) woman's own health care, (2) major household purchases, and (3) visits to the woman's family or relatives.

**Sample:** Currently married women age 15-49

Seventy-one percent of women participate in all three specified household decisions alone or jointly with their husband and 11 percent do not participate in any of the three. Overall, 80-81 percent of women participate in each of the three decisions alone or jointly with their husband (**Table 14.7.1**).

Currently married men were also asked about participation in decisions about their own health care and major household purchases. Overall, 84 percent of men participate in both decisions, while 4 percent participate in neither decision (**Table 14.7.2**). Ninety percent of men participate in decisions about their own health care and 91 percent participate in decisions about major household purchases. Notably, one-third of men make decisions about their own health care alone, compared with only 10 percent of women.

**Figure 14.3 Women's Participation in Decision Making**

*Percentage of currently married women age 15-49*

**Trends:** Women's participation in decision making about major household purchases has increased since NFHS-4, from 73 percent in NFHS-4 to 80 percent in NFHS-5. A similar increase by 6 percentage points (from 75% to 81%) is also observed for women's participation in their own health care in the 4 years since NFHS-4, and for their participation in decisions about visits to family or relatives (from 75% to 81%).

#### Patterns by background characteristics

- Women's involvement in all three decisions increases with age from 51 percent among women age 15-19 to 75 percent among women age 40-49 (**Table 14.7.1**).
- Women employed for cash are more likely to be involved in all three decisions (75%) than women who are not employed (70%) and women who are employed but not for cash (69%).
- Women's participation in decision making increases slightly with wealth (71% of women in the lowest wealth quintile participate in all three decisions, compared with 74% of women in the highest wealth quintile).
- Women's participation in all three decisions varies across states/UTs, ranging from 48 percent in Ladakh to a very high level of 95 percent in Nagaland (**Table 14.8**).

### 14.5 MEN'S ATTITUDES TOWARD WOMEN'S ROLES IN DECISION MAKING

#### **Men's egalitarian attitudes toward a wife's role in decision making**

Men are asked who in a couple should have the greater say (the husband, the wife, or both) in each of the following decisions: making major household purchases; making purchases for daily household needs; visits to the wife's family or relatives; what to do with money the wife earns; and how many children to have. Men who say that a wife should have an equal or greater say as her husband are considered to have more egalitarian attitudes.

**Sample:** Men age 15-49

Overall, 57 percent of men say that a wife should have an equal or greater say in all of the five specified decisions, and only 5 percent say that she should not have an equal or greater say in any of the five decisions (**Table 14.10**). For all types of decisions, men are much more likely to say that the wife and husband should have an equal say than either one should have a greater say. For example, for decisions regarding how many children to have, men are most likely to say that both husband and wife should have an equal say (87%), and only 9 percent say that the husband should have more of a say. For decisions about major household purchases, men are more likely to say that the husband should have a greater say than the wife (29% versus 8%), and this is also true regarding decisions about visits to the wife's family or relatives (22% versus

10%). For decisions about purchases for daily household needs, men are somewhat more likely to say that the wife should have the greater say than to say that the husband should have the greater say (25% versus 20%). However, for decisions about what to do with the money the wife earns, an equal proportion (17%) of men say that the husband and the wife should have a greater say and two-thirds of men (66%) say that both should have an equal say.

**Trends:** The percentage of men who agree that a wife should have an equal or greater say in all the five specified decisions has slightly decreased in the 4 years since NFHS-4 from 59 percent to 57 percent in NFHS-5 (**Table 14.10**).

#### Patterns by background characteristics

- The proportion of men who say that a wife should have an equal or greater say in all five specified decisions increases with age from 55 percent among men age 20-24 to 57 percent among men age 30-49 (**Table 14.10**).
- Egalitarian attitudes regarding women's role in household decision making are more prevalent among men in urban areas than in rural areas, men with more years of schooling than less schooling, and men in higher wealth quintiles than in lower wealth quintiles (**Table 14.10**).
- The proportion of men who say that a wife should have an equal or greater say in all five decisions ranges from 30 percent in Karnataka to more than 80 percent in Chandigarh, Haryana, Himachal Pradesh, and Uttarakhand (81-83%) (**Table 14.8**).

## 14.6 WOMEN'S ACCESS TO MONEY AND MICROCREDIT

Several different measures of women's access to and use of financial resources were included in NFHS-5. Over half (51%) of women in India say that they have some money that they alone can decide how to use. Nearly four-fifths (79%) of women have a bank or savings account that they themselves use. Fewer women, however, know about a microcredit programme (51%), and only 11 percent have ever taken a microcredit loan (**Table 14.11**).

**Trends:** The percentage of women who have some money of their own that they alone can use has increased from 42 percent in NFHS-4 to 51 percent in NFHS-5. However, the percentage of women who have a bank or savings account that they themselves use has substantially increased from 53 percent in NFHS-4 to 79 percent in NFHS-5. Knowledge of microcredit programmes has increased from 41 percent in NFHS-4 to 51 percent in NFHS-5, and use of microcredit programmes by women has slightly increased, from 8 percent to 11 percent.

#### Patterns by background characteristics

- The proportion of women who have some money that they can decide how to use, and who have a bank or savings account that they themselves use are higher in urban areas than rural areas, and the proportion increases with age and wealth. However, the proportion of women having knowledge of microcredit programmes is the same in urban and rural areas (51%), and it is highest among women who are widowed/divorced/separated (58%) (**Table 14.11**).
- Women's use of microcredit programmes also increases with age, from 2 percent among women age 15-19 to 16 percent each among women age 30-39 and age 40-49, and is also higher in rural areas (12%) than urban areas (9%). However, use of microcredit programmes declines with schooling after peaking at 17 percent for women with less than five years of schooling. This proportion varies inconsistently with wealth; women in the second and middle wealth quintiles are more likely than women in other quintiles to have taken a microcredit loan. Widowed, divorced, separated, and deserted women are more likely (18%) than any other group of women to have taken a microcredit loan, followed by women with less than 5 years of schooling (17%).
- The proportion of women who have a bank or savings account that they use ranges from 64 percent in Nagaland to 93 percent in Puducherry (**Table 14.12**).

- The percentage of women who have taken a microcredit loan is highest in the South and the East. In Andhra Pradesh, 30 percent of women have ever taken a microcredit loan, followed by 25 percent in Odisha, 24 percent in Telangana, and 21 percent in Tripura.

## 14.7 FREEDOM OF MOVEMENT

### Freedom of movement

Women are considered to have freedom of movement if they are usually allowed to go alone to all three of the following places: to the market, to the health facility, and to places outside the village or community.

**Sample:** Women age 15-49

Fifty-six percent of women are allowed to go alone to the market, 52 percent to the health facility, and 50 percent to places outside the village or community. Overall, only 42 percent of women in India are allowed to go alone to all three places and 5 percent are not allowed to go alone to any of the three places (**Table 14.13**).

**Trends:** Slightly more women age 15-49 have reported that they have freedom of movement in the 4 years since NFHS-4. In NFHS-4, only 41 percent of women they were allowed to go alone to the market, the health facility, and to places outside the village or community. This percentage has increased marginally to 42 percent in NFHS-5.

### Patterns by background characteristics

- The proportion of women who are allowed to go alone to all three places increases steadily with age, from 26 percent among women age 15-19 to 55 percent among women age 40-49 (**Table 14.13**).
- Women's freedom of movement increases with household wealth, but it does not vary consistently with education. The percentage of women who are allowed to go alone to all three places increases from 40 percent among women in the lowest wealth quintile to 50 percent in the highest wealth quintile (**Table 14.13**).
- The proportion of women who report freedom of movement varies greatly by state. In Himachal Pradesh, 82 percent of women are allowed to go alone to all three places, compared with only 2 percent in Lakshadweep, 15 percent in Kerala, and less than one-third in Goa, Odisha, Manipur, Nagaland, and Karnataka (**Table 14.12**).

## 14.8 ATTITUDES TOWARD WIFE BEATING

### Attitudes toward wife beating

Respondents are asked if they agree that a husband is justified in hitting or beating his wife under each of the following seven circumstances: she goes out without telling him, she neglects the house or the children, she argues with him, she refuses to have sex with him, she doesn't cook food properly, he suspects her of being unfaithful, and she shows disrespect for her in-laws. Respondents who answer "yes" in at least one circumstance are considered to have attitudes that justify wife beating.

**Sample:** Women and men age 15-49

An important indicator of empowerment is the rejection of norms that underlie and reinforce gender inequality. One such gendered norm is husbands' "right" to control their wives in various ways, including through violence. Rejection of such norms signifies greater gender equality. Forty-five percent of women and 44 percent of men believe that a husband is justified in beating his wife in at least one of seven specified circumstances (**Table 14.14.1** and **Table 14.14.2**). Women and men are both most likely to agree that a husband is justified in hitting or beating his wife if she shows disrespect for

her in-laws (32% and 31%, respectively), and are both least likely to agree that a husband is justified in hitting or beating his wife if she refuses to have sex with him (11% and 10%, respectively) (**Figure 14.4**).

**Trends:** Attitudes toward wife beating have changed since NFHS-4. For women, agreement with any of the seven reasons justifying wife beating has declined by 7 percentage points from 52 percent in NFHS-4; but for men, it has increased by 2 percentage points, from 42 percent in NFHS-4.

### Figure 14.4 Attitudes toward Wife Beating

Percentage of women and men age 15-49 who agree that a husband is justified in beating his wife for specific reasons

### Patterns by background characteristics

- Agreement with wife beating tends to increase with age for women but it decreases slightly with age for men (**Table 14.14.1** and **Table 14.14.2**).
- For both women and men, agreement with wife beating is lower in urban than rural areas and it tends to decrease with schooling and wealth. For example, agreement declines from 53 percent among women and 51 percent among men with less than 5 years of schooling to 38 percent among women, and 39 percent among men with 12 or more years of schooling.
- Agreement with wife beating is lower among Jains (24%) than among any other subgroup of men.
- There is large variation across states in women's and men's agreement with wife beating. For women agreement with at least one reason for wife beating ranges from a low 9 percent in Dadra & Nagar Haveli and Daman & Diu, and 14 percent each in Chandigarh and the Andaman & Nicobar Islands, and 15 percent in Himachal Pradesh to a very high level of 78 percent in Tamil Nadu and 84 percent each in Andhra Pradesh and Telangana. The corresponding range for men is from 9 percent in Chandigarh to 82 percent in Karnataka (**Table 14.15**).

## 14.9 ATTITUDES TOWARD NEGOTIATING SAFER SEXUAL RELATIONS WITH HUSBAND

### Attitudes toward negotiating safer sexual relations with husband

Respondents are asked if they think a wife is justified in refusing to have sex with her husband if she knows he has a sexually transmitted disease, she knows he has sex with other women, and she is tired or not in the mood. Respondents who answer "yes" to one or more of these circumstance are considered to have more gender egalitarian attitudes.

**Sample:** Women and men age 15-49

The majority of women (80%) and men (66%) in India believe that a woman is justified in refusing sex to her husband for all of the three specified reasons. Eight percent of women and 10 percent of men do not agree that a wife can refuse sex for any of the three reasons. At least four of 5 women and men agree with each of the reasons (**Table 14.16.1** and **Table 14.16.2**).

**Trends:** Adult women and men who agree that women can refuse sex to their husband for all three specified reasons has increased since NFHS-4 by 12 percentage points for women and men, from its level in NFHS-4 (68% women and 63% men).

### Patterns by background characteristics

- There is a not much variation in women's and men's agreement with women's right to refuse sex to their husbands for all three specified reasons by most background characteristics, except religion (**Table 14.16.1** and **Table 14.16.2**).
- Agreement with all three reasons is highest among Jain, Sikh, and Buddhist/Neo-Buddhist women and men. Ninety-three percent of Jain women and 83 percent of Jain men agree with all three reasons for a wife to refuse sex to her husband.
- Agreement with all three reasons varies greatly across states. Women are most likely to agree with all three reasons in Delhi (94%), Himachal Pradesh, Uttarakhand, and Goa (90% each) and least likely to agree with all three reasons in Jammu & Kashmir (60%) and Ladakh (59%). Men are most likely to agree with all three reasons in Goa (93%) and Lakshadweep (90%) and least likely to agree with all three reasons in Ladakh (43%) and Meghalaya (39%) (**Table 14.17**).

Men were asked some additional questions to assess gender egalitarian attitudes. In particular, men were asked, if a woman refuses to have sex with her husband when he wants her to, does he have the right to display each of the following four behaviours: get angry and reprimand her; refuse to give her money or other means of financial support; use force and have sex with her even if she doesn't want to; and go and have sex with another woman.

In India, only 6 percent of men age 15-49 agree that men have the right to display all four of these behaviours if a wife refuses him sex, and 72 percent do not agree with any of the four behaviours. However, 19 percent of men do agree that a husband has the right to get angry and reprimand a woman if she refuses to have sex with her husband (**Table 14.18**). In almost all states, the percentage of men who agree with none of the four behaviours is well above 70 percent, and the percentage of men who agree with none of the four behaviours is less than 50 percent only in Punjab (21%), Chandigarh (28%), Karnataka (45%), and Ladakh (46%) (**Table 14.19**). The percentage of men who agree with none of the four behaviours has decreased by 5 percentage points since NFHS-4 when it was 77 percent.

More than four in five women (82%) can say no to their husband if they do not want to have sexual intercourse (**Table 14.20**). Women are most likely to be able to say no in Goa (92%) and least likely to be able to say no in Arunachal Pradesh (63%) and Jammu & Kashmir (65%) (**Table 14.21**).

## 14.10 WOMEN'S AND MEN'S OWNERSHIP OF ASSETS

### Ownership of a house or land

Respondents who own a house or land, whether alone or jointly with someone else.

**Sample:** Women and men age 15-49

NFHS-5 indicates that in India, more men than women age 15-49 own property. Forty-two percent of women and 60 percent of men own a house, and 32 percent of women and 42 percent of men own land either alone or jointly with someone else (**Table 14.22** and **Figure 14.5**).

### Patterns by background characteristics

- Ownership of property increases sharply with age for both women and men. However, the increase is much greater for men than for women. For example, for men, ownership of a house doubles from 40 percent among men age 15-19 to 80 percent among men age 40-49; whereas the corresponding increase for women is from 30 percent to 52 percent.
- Ownership of a house and land varies with residence. Rural women and men are more likely than urban women and men to own a house and to own land.
- Property ownership declines with schooling and wealth for both women and men. Ownership of a house declines from 45 percent for women in the lowest wealth quintile to 40 percent for women in the highest wealth quintile; for men the corresponding decline is from 64 percent to 54 percent.
- House ownership among women is higher in Ladakh and Arunachal Pradesh, where more than 2 out of 3 women own a house alone or jointly with some else (72% and 69%, respectively), and land ownership is also most common in Ladakh and Arunachal Pradesh, where more than 3 in 5 women own land alone or jointly (64% and 63%, respectively). In the South, women's ownership of property is most common in Karnataka and Telangana (**Table 14.23**).

**Figure 14.5 Ownership of Assets**

*Percentage of women and men age 15-49*

### 14.11 OWNERSHIP AND USE OF A MOBILE PHONE

Women age 15-49 were asked if they had a mobile phone that they themselves use. In addition, women who said they had a mobile phone were asked if they can read text messages. More than half (54%) of women have a mobile phone that they themselves use, and among women who have a mobile phone, 71 percent say that they can read text messages (**Table 14.22**).

### Patterns by background characteristics

- Ownership of a mobile phone that women themselves use increases with age, from 32 percent among women age 15-19 to 65 percent among women age 25-29 and then decreases among older women. Among women with a mobile phone, the ability to read text messages, however, declines with age from 89 percent among women age 15-19 to 53 percent among women age 40-49.
- Rural women and women with no schooling are less likely than most other women to have a mobile phone that they themselves use and to be able to read text messages if they have a mobile phone. Urban women (69%) are more likely than rural women (47%) to own a mobile phone that they themselves use (**Figure 14.6**).

### Figure 14.6 Ownership of Financial Assets and Mobile Phone

Percentage of women age 15-49

- Mobile phone ownership and the ability to read text messages both increase sharply with wealth. Only 33 percent of women in the lowest wealth quintile have a mobile phone that they themselves use, compared with 79 percent of women in the highest wealth quintile.
- Ownership of a mobile phone that women themselves use varies from 39 percent in Madhya Pradesh and 41 percent in Chhattisgarh to 91 percent in Goa, followed by 89 percent in Sikkim and 87 percent in Kerala. At least three-fifths of the women who have a mobile phone they themselves use are able to read text messages in every state except Bihar (Table 14.23).

## LIST OF TABLES

For detailed information on women's empowerment, see the following tables:

| Tables        |                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------|
| Table 14.1    | Employment and cash earnings                                                                                          |
| Table 14.2    | Employment and cash earnings by state/union territory                                                                 |

<sup>1</sup> Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals. The remaining households are non-nuclear households.

Table 14.12 Women's access to money and credit and freedom of movement by state/union territory

Percentage of women age 15-49 who have access to money, who know of a microcredit programme, and have taken a loan from a microcredit programme, and who are allowed to go to three specified places alone; among women who own a mobile phone, percentage who use it for financial transactions, by state/union territory, India, 2019-21

| State/union territory                | Women's access to money                                   |                                                                        | Women's knowledge and use of microcredit programmes      |                                                               |                                                                       |                                                            |

<sup>1</sup> Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals. The remaining households are non-nuclear households.

Table 14.14.2 Attitudes toward wife beating: Men

Percentage of men age 15-49 who agree that a husband is justified in hitting or beating his wife for specific reasons, by background characteristics, India, 2019-21

| Background characteristic           | Percentage who agree that a husband is justified in hitting or beating his wife if: |                                    |                     |                                                 |                           |                               |                                  | Number of men |
|-------------------------------------|-------------------------------------------------------------------------------------|------------------------------------|---------------------|-------------------------------------------------|---------------------------|-------------------------------|----------------------------------|---------------|
|                                     | She goes out without telling him                                                    | She neglects the house or children | She argues with him | She refuses to have sexual intercourse with him | She doesn't cook properly | He suspects she is unfaithful | She shows disrespect for in-laws |               |
| <b>Age</b>                          |                                                                                     |                                    |                     |                                                 |                           |                               |                                  |               |

<sup>1</sup> Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted or fostered) with or without unrelated individuals. The remaining households are non-nuclear households.

Table 14.23 Ownership of assets by state/union territory

Percentage of women and men age 15-49 who own a house or land either alone or jointly, percentage of women who own a mobile phone that they themselves use, and among women who own a mobile phone, percentage who can read SMS messages, according to state/union territory, India, 2019-21

| State/union territory                | Women                        |                           |                                              | Among women who have a mobile phone, percentage who can read SMS messages | Men                          |                           |

## Key Findings

- **Experience of violence from anyone:** Twenty-nine percent of women age 18-49 have experienced physical violence since age 15, and 6 percent have ever experienced sexual violence in their lifetime. Three percent of ever-pregnant women age 18-49 have experienced physical violence during any pregnancy.
- **Spousal violence:** Thirty-two percent of ever-married women age 18-49 have experienced physical, sexual, or emotional spousal violence. The most common type of spousal violence is physical violence (28%), followed by emotional violence (14%). Six percent of ever-married women age 18-49 have experienced spousal sexual violence.
- **Trends in spousal physical or sexual violence:** Ever-married women's ever experience of spousal physical or sexual violence has declined from 31 percent in NFHS-4 to 29 percent in NFHS-5.
- **Injuries due to spousal violence:** One-fourth of ever-married women age 18-49 who have experienced spousal physical or sexual violence report having physical injuries, including 7 percent who have had eye injuries, sprains, dislocations, or burns and 6 percent who have had deep wounds, broken bones, broken teeth, or any other serious injury.
- **Help seeking:** Only 14 percent of women who have experienced physical or sexual violence by anyone have sought help to stop the violence.

Gender-based violence against women has been acknowledged worldwide as a violation of basic human rights. Increasing research has highlighted the health burdens, intergenerational effects, and demographic consequences of such violence. Gender-based violence is defined by the United Nations as any act of violence that results in physical, sexual, or psychological harm or suffering to women, girls, men, and boys, as well as threats of such acts, coercion, or the arbitrary deprivation of liberty. This chapter highlights key results of domestic violence, one of the most common forms of gender-based violence against women.

Domestic violence has been recognized since 1983 as a criminal offence under Indian Penal Code 498-A. However, it was not until the enactment of the Protection of Women from Domestic Violence Act 2005 (PWDVA), which came into effect in 2006, that civil protections were afforded to victims of domestic violence. The PWDVA provides a definition of domestic violence that is comprehensive and includes all forms of physical, emotional, verbal, sexual, and economic violence, and covers both actual acts of such violence and threats of violence. In addition, the PWDVA recognizes marital rape and covers harassment in the form of unlawful dowry demands as a form of abuse. The Act requires the appointment of protection officers to assist victims, and further acknowledges the importance of collaboration between the government and external organizations in protecting women. Primarily meant to provide protection from domestic violence for wives and female live-in partners at the hands of husbands and male live-in partners or their relatives, the PWDVA has been extended to also protect women living in a household, such as sisters, widows, or mothers. However, despite the PWDVA, violence against women and girls continues to be a major

(POCSO) Act, 2012 (Act No. 32 of 2012) came into effect from 14<sup>th</sup> November 2012). This is an Act to protect children from offences of sexual assault, sexual harassment and pornography and provide for establishment of Special Courts for trial of such offences and for matters connected therewith or incidental thereto. With this Act, now India has a comprehensive law to protect children from such offences and to safeguard their interests at every stage of the judicial process by adopting children-friendly mechanisms.

To help India monitor progress toward reducing domestic violence, NFHS-5 included a module of questions on domestic violence that was administered to women age 18-49 in the subsample of households selected for the state module. A similar module was also included in NFHS-4, although the NFHS-4 module was administered to women age 15-49. Therefore, comparisons over time cannot be made for women age 18-49. In accordance with the World Health Organization's guidelines on the ethical collection of information on domestic violence, only one eligible woman per household was randomly selected for the module, and the module was not administered to eligible woman age 18-49 if privacy could not be obtained after at least three attempts during the survey. In total, 72,056 women completed the domestic violence module. Only 4 percent of women eligible for the domestic violence module could not be successfully interviewed with the module because privacy could not be obtained or for other reasons. Special weights were used to adjust for the selection of only one woman per household and to ensure that the domestic violence subsample was nationally representative.

## 15.1 MEASUREMENT OF VIOLENCE

In NFHS-5, information was obtained from never-married women age 18-49 on their experience of violence committed by anyone and from ever-married women age 18-49 on their experience of violence committed by their current and former husbands and by others. More specifically, violence committed by the current husband for currently married women and by the most recent husband for formerly married women was measured by asking interviewed ever-married women age 18-49 if their husband ever did the following to them:

**Physical spousal violence:** push you, shake you, or throw something at you; slap you; twist your arm or pull your hair; punch you with his fist or with something that could hurt you; kick you, drag you, or beat you up; try to choke you or burn you on purpose; or threaten or attack you with a knife, gun, or any other weapon

**Sexual spousal violence:** physically force you to have sexual intercourse with him even when you did not want to; physically force you to perform any other sexual acts you did not want to; force you with threats or in any other way to perform sexual acts you did not want to

**Emotional spousal violence:** say or do something to humiliate you in front of others; threaten to hurt or harm you or someone close to you; insult you or make you feel bad about yourself

In addition, information was obtained from interviewed women age 18-49 (married and unmarried) about physical violence committed by anyone (other than a current or most recent husband) since they were age 15 by asking if anyone had hit, slapped, kicked, or done something else to hurt them physically. Interviewed women age 18-49 were asked about the experience of sexual violence committed by anyone (other than a current or most recent husband) by asking if at any time in their life, as a child or as an adult, they were forced in any way to have sexual intercourse or to perform any other sexual acts when they did not want to do. Finally, women age 18-49 who had ever been pregnant were asked about their experience of physical violence committed by anyone during any pregnancy.

## 15.2 WOMEN'S EXPERIENCE OF PHYSICAL VIOLENCE

### Physical violence by anyone

Women age 18-49 who have experienced any physical violence (committed by a husband or anyone else) since age 15 and in the 12 months preceding the survey.

**Sample:** Women age 18-49

Twenty-nine percent of women age 18-49 in India have ever experienced physical violence since age 15, and 22 percent have experienced physical violence in the 12 months preceding the survey (**Table 15.1**). Among women age 18-49 who have ever been pregnant, 3 percent have experienced physical violence during any pregnancy (**Table 15.2** and **Figure 15.1**).

**Figure 15.1 Violence during Pregnancy by Level of Schooling**

*Percentage of ever-pregnant women age 18-49 who have experienced physical violence during any pregnancy*

### Patterns by background characteristics

- Women's experience of physical violence increases with age, from 16 percent among women age 18-19 to 32 percent among women age 40-49. The experience of violence is less common among never-married women than among women who have ever been married (**Table 15.1** and **Figure 15.2**).
- The experience of physical violence is more common among women in rural areas (31%) than among women in urban areas (24%).
- Women's experience of violence declines sharply with women's schooling and wealth. By schooling, the percentage of women who report physical violence declines from 39 percent among women with no schooling to 17 percent among women with 12 or more years of schooling. Similarly, the experience of physical violence ranges from 38 percent among women in the lowest wealth quintile to 17 percent among women in the highest wealth quintile.
- Women who are employed are more likely to experience physical violence than women who are not employed. For example, 36% of women who are employed for cash, compared with 25% of women who are not employed, have experienced physical violence since age 15 years.

**Figure 15.2 Women's Experience of Violence by Marital Status**

*Percentage of women age 18-49*

### 15.2.1 Perpetrators of Physical Violence

Among ever-married women age 18-49 who have experienced physical violence since age 15, 83 percent report their current husband as the perpetrator of the violence, and 9 percent report their former husband (Table 15.3). For never-married women who have experienced physical violence since age 15, the most common perpetrators are mothers or step-mothers (60%), fathers or step-fathers (36%), sisters or brothers (25%), and teachers (8%).

## 15.3 EXPERIENCE OF SEXUAL VIOLENCE

### Sexual violence

Women who have experienced any sexual violence (committed by a husband or anyone else) ever and in the 12 months preceding the survey.

**Sample:** Women age 18-49

### 15.3.1 Prevalence of Sexual Violence

Women age 18-49 were asked if they had ever experienced sexual violence by anyone as a child or as an adult. Overall, 6 percent of women report having ever experienced sexual violence in their lifetime (Table 15.4).

#### Patterns by background characteristics

- Women's experience of sexual violence is somewhat lower among younger women (4% each for women age 18-19 and 20-24, 6% for women age 25-29, and 7% for women age 30 and over).
- Experience of sexual violence decreases sharply with schooling, from 9 percent among women with no schooling to 3 percent among women with 12 or more years of schooling. Women's experience of sexual violence declines similarly with wealth, from 10 percent among women in the lowest wealth quintile to 3 percent among women in the highest wealth quintile.
- Widowed, divorced, separated, or deserted women and women from 'other' religions are far more likely than any other women to report having experienced sexual violence.

### 15.3.2 Perpetrators of Sexual Violence

NFHS-5 shows that sexual violence is most often committed by individuals with whom women have an intimate relationship. Among ever-married women age 18-49 who have ever experienced sexual violence, 82 percent report their current husband and 14 percent report a former husband as perpetrators. Among never-married women who

reported sexual violence, the most common perpetrators were ‘other’ relatives (39%), followed by a current or former boyfriend (16%) and a family friend (12%). Some never-married women mention stranger (5%), teacher, father/step-father, and brother/step-brother (4% each) as perpetrators (**Table 15.6**).

## 15.4 EXPERIENCE OF DIFFERENT TYPES OF VIOLENCE

Physical violence and sexual violence may not occur in isolation; rather, women may experience a combination of different types of violence. Twenty-five percent of women age 18-49 have experienced physical violence only, 6 percent have experienced both physical and sexual violence, and 1 percent have experienced sexual violence only. About one-third (32%) of women age 18-49 in India have experienced physical or sexual violence (**Table 15.7**). The percentage of women who have experienced physical or sexual violence ranges from 3 percent in Lakshadweep to 42-49 percent in Puducherry, Tamil Nadu, Bihar, and Karnataka.

## 15.5 MARITAL CONTROL BY HUSBAND

### Marital control

Women whose current husband (if currently married) or most recent husband (if formerly married) demonstrates at least one of the following controlling behaviours: is jealous or angry if she talks to other men; frequently accuses her of being unfaithful; does not permit her to meet her female friends; tries to limit her contact with her family; insists on knowing where she is at all times; and does not trust her with any money.

**Sample:** Ever-married women age 18-49

Attempts by husbands to closely control and monitor their wives’ behaviour are important early warning signs and correlates of violence in a relationship. Because the concentration of behaviours is more significant than the display of any single behaviour, the proportion of women whose husbands display at least three of the specified behaviours is also discussed in this section.

Twenty-six percent of ever-married women report that their husband is jealous or angry if they talk to other men, 21 percent report that he does not trust them with any money, 20 percent report that he does not permit them to meet their female friends, 19 percent report that he insists on knowing where they are at all times, 16 percent report that he tries to limit their contact with their families, and 11 percent report that he frequently accuses them of being unfaithful. Overall, 18 percent of ever-married women report that their husband displays three or more of the specified behaviours and 54 percent report that he displays none of them (**Table 15.8**).

### Patterns by background characteristics

- Women’s reports of controlling behaviours by their husband decline with age. Overall, 20 percent of younger ever-married women age 18-19 report that their husband displays at least three of the specified behaviours, compared with 17 percent among women age 40-49 (**Table 15.8**).
- Women’s experience of at least three controlling behaviours is higher in rural areas (20%) than in urban areas (15%) and declines with women’s schooling and wealth.
- Hindu and Muslim women are more likely (19% each) to have husbands with at least three controlling behaviours than women belonging to any other religious group.
- Women’s reports of husband’s controlling behaviours vary greatly by whether or not the respondent is afraid of her husband. While 10 percent of women who say that they are never afraid of their husband report at least three controlling behaviours by their husband, this percentage is 41 percent among women who are afraid of their husband most of the time.

15.6 FORMS OF SPOUSAL VIOLENCE

Spousal violence

Women who have experienced any of the specified acts of physical, sexual, or emotional violence committed by their current husband (if currently married) or their most recent husband (if formerly married), ever and in the 12 months preceding the survey.

**Sample:** Ever-married women age 18-49

15.6.1 Prevalence of Spousal Violence

Thirty-two percent of ever-married women have ever experienced spousal physical, sexual, or emotional violence by their current husband (for currently married women) or their most recent husband (for formerly married women), and 27 percent have experienced at least one of these forms of violence in the 12 months preceding the survey (Table 15.9).

Twenty-nine percent of ever-married women have experienced spousal physical violence, with 23 percent experiencing such violence in the past 12 months. Six percent have experienced spousal sexual violence, with 5 percent experiencing it in the past 12 months. Spousal emotional violence was reported by 14 percent of ever-married women, and 12 percent reported such violence in the past 12 months.

Of the acts of physical violence committed by the current or most recent husbands, the most common type is slapping, reported by 25 percent of ever-married women. Twelve percent of women reported being pushed, shaken, or having something thrown at them; 10 percent reported having their arm twisted or hair pulled; and 8 percent reported being punched with his fist or with something that could hurt them or being kicked, dragged, or beaten up. Two percent of women reported that their husband tried to choke or burn them on purpose and 1 percent reported that their husband had threatened or attacked them with a knife, gun, or other weapon. The form of sexual violence most commonly reported by women is that their husband used physical force to have sexual intercourse when they did not want to (5%). Four percent reported that their husband forced them with threats or in other ways to perform sexual acts they did not want to, and 2 percent reported that their husband forced them to perform any sexual acts they did not want to (Figure 15.3).

Figure 15.3 Types of Spousal Violence

Percentage of ever-married women age 18-49 who have ever experienced specified acts of spousal physical or sexual violence

Women reporting emotional violence were most likely to report that their husband said or did something to humiliate them in front of others (10%), followed by their husband insulting them or making them feel bad about themselves (9%). Six percent of women said that their husband threatened to hurt or harm them or someone close to them.

Women who were married more than once were also asked about spousal physical or sexual violence by any other husband. Twenty-nine percent of them have ever experienced spousal physical or sexual violence committed by any husband, only slightly higher than the percentage of women who have experienced physical or sexual violence committed by the current or most recent husband (**Table 15.9**). During the 12 months before the survey, 24 percent of ever-married women experienced physical or sexual violence by any husband, either current or previous (**Table 15.9** and **Table 15.10**).

Patterns by background characteristics

- Ever experience of one or more forms of spousal violence by ever-married women increases sharply with women’s number of living children, from 24 percent among women with no children to 41 percent among women with five or more children (**Table 15.11**).
- Women in rural areas are more likely (34%) than women in urban areas (27%) to experience one or more forms of spousal violence.
- Although all forms of spousal violence decline sharply with schooling and wealth, 1 in 5 women with 12 or more years of schooling and women who are in the highest wealth quintile report ever having experienced physical, sexual, or emotional spousal violence.
- Intergenerational effects of spousal violence are evident in India. Women who report that their father beat their mother are much more likely (58%) to have themselves experienced spousal violence than women who report that their fathers did not beat their mother (25%).

Patterns by husband’s characteristics and empowerment indicators

- Based on the reports of ever-married women age 18-49 of their experience of spousal violence, husbands who have completed 12 or more years of schooling are half as likely (22%) to commit physical, sexual, or emotional spousal violence as husbands with no schooling (43%). Notably, the variation in spousal violence by women’s own education is similar to the variation by the education of their husband (**Table 15.12**).
- Women with husbands having the same education level as them are less likely (26%) to have experienced spousal violence than women in couples in which neither attended school (43%) or one or the other has more schooling.

- The likelihood of experiencing spousal violence increases sharply with the number of marital control behaviours displayed by husbands; 75 percent of women whose husbands displayed 5-6 of the specified marital control behaviours have ever experienced spousal violence, compared with 17 percent of women whose husbands did not display any specified behaviours.

- Experience of spousal physical or sexual violence varies greatly with the level of the husband’s alcohol consumption. Seventy-one percent of women whose husbands often get drunk have experienced spousal physical or sexual violence, compared with 23 percent of women whose husbands do not drink alcohol (**Figure 15.4**).

Figure 15.4 Spousal Violence by Husband's Alcohol Consumption

Percentage of ever-married women who have ever experienced spousal physical or sexual violence

- Women’s experience of spousal violence does not vary linearly with women’s participation in household decision-making, and their acceptance of wife beating. However, more than 40 percent of the women who agree with 3-7 of the specified reasons for wife beating have experienced spousal violence, compared with 23% of women who agree with none of the specified reasons for wife beating.

### Figure 15.5 Spousal Violence by State/UT

Percentage of ever-married women age 18-49 who have ever experienced spousal physical, sexual, or emotional violence

- Fear of husband and spousal violence are highly correlated. Women who say that they are afraid of their husband most of the time are most likely to have ever experienced spousal violence (59%), followed by women who are sometimes afraid of their husbands (34%). Among women who say that they are never afraid of their husband, 15 percent have experienced spousal violence.
- Women's experience of any spousal physical, sexual, or emotional violence varies greatly across states/UTs, from 1 percent in Lakshadweep to 10 percent in Goa and 11 percent each in Himachal Pradesh and Nagaland to 40-43 percent of women in Tamil Nadu, Telangana, Manipur and Bihar, and to 48 percent in Karnataka (Table 15.13 and Figure 15.5).

Table 15.14 shows when spousal violence first occurred in relation to the start of marriage for women married only once. Among currently married women age 18-49 who have been married only once, 11 percent reported their first ever experience of spousal violence within the first 2 years of marriage, and 21 percent experienced such violence within 5 years. This suggests that a large proportion of spousal violence begins early in marriage.

## 15.7 INJURIES TO WOMEN DUE TO SPOUSAL VIOLENCE

### Injuries due to spousal violence

Women who have the following types of injuries from spousal violence: cuts, bruises, or aches; severe burns; eye injuries, sprains, dislocations, or burns; deep wounds, broken bones, broken teeth, or any other serious injuries

**Sample:** Ever-married women age 18-49 who have experienced physical or sexual violence committed by their current husband (if currently married) or most recent husband (if formerly married)

Among ever-married women who have experienced any spousal physical or sexual violence, one-fourth (25%) have sustained some kind of injury, and the percentage who have been injured is similar for women who have ever experienced spousal violence and have experienced it in the past 12 months (**Table 15.15**).

Cuts, bruises, or aches are the most common types of injuries (22%) reported by women who have experienced spousal physical or sexual violence. However, 7 percent of women who experienced spousal physical or sexual violence report serious injuries like eye injuries, sprains, dislocations, or burns and 6 percent have had deep wounds, broken bones, or broken teeth. Three percent report having experienced severe burns.

## 15.8 VIOLENCE INITIATED BY WOMEN AGAINST HUSBANDS

### Initiation of physical violence by wives

Women who have ever hit, slapped, kicked, or done anything else to physically hurt their current (if currently married) or most recent (if formerly married) husband at times when he was not already beating or physically hurting her.

**Sample:** Ever-married women age 18-49

Four percent of ever-married women have ever initiated physical violence against their husband when he was not already beating or physically hurting them. Three percent reported that they initiated such violence in the past 12 months (**Table 15.16**).

Women who have experienced spousal violence are much more likely than women who have not experienced spousal violence to have ever initiated violence against their husband. Ten percent of women who have ever experienced spousal violence perpetrated such violence, compared with 1 percent who have never experienced such spousal violence. Nonetheless, among women who initiated violence, the percentage who experience violence is much lower than the percentage of women who have ever experienced spousal physical violence.

15.9 HELP-SEEKING AMONG WOMEN WHO HAVE EXPERIENCED VIOLENCE

Of all women in India who have ever experienced any type of physical or sexual violence, only 14 percent have sought help for the violence, and 77 percent have never sought any help nor told anyone about the violence they experienced (Table 15.17 and Figure 15.6).

Figure 15.6 Help Seeking by Type of Violence Experienced

Percentage of women age 18-49 who have experienced physical or sexual violence who sought help

Patterns by background characteristics

- Help seeking is much more common among women who have experienced both physical and sexual violence (26%) than among women who have experienced only physical violence or only sexual violence (10-12%).
- Women who have experienced violence by a previous husband only are much more likely to have sought help (24%) than women who have experienced violence only by their current husband (11%).
- Help seeking to stop the violence does not vary much by most other characteristics.

15.9.1 Sources of Help

Among the women who have experienced physical or sexual violence and sought help, the most common source for help was the woman’s own family (61%). The second most common source for help was the husband’s family (29%). Seventeen percent of women sought help from a friend. Among institutional sources of help, the most common is police (6%), followed by a social service organization (3%). Only 2 percent each have ever sought help from a doctor or medical personnel or a lawyer (Table 15.18).

<sup>1</sup> Includes violence in the past 12 months. For women who were married before age 15 and who reported physical violence by their husband, the violence could have occurred before age 15.

<sup>2</sup> Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals. The remaining households are non-nuclear households.

Table 15.2 Experience of violence during pregnancy

Among women age 18-49 who have ever been pregnant, percentage who have ever experienced physical violence during pregnancy, by background characteristics, India, 2019-21

<sup>1</sup> Includes only emotional violence by current or most recent husband. Information on emotional violence by other husbands not collected.

<sup>2</sup> Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals. The remaining households are non-nuclear households.

Table 15.11 Spousal violence by background characteristics

Percentage of ever-married women age 18-49 who have ever experienced emotional, physical, or sexual violence committed by their husband, according to background characteristics, India 2019-21

| Background characteristic              | Emotional violence | Physical violence | Sexual violence | Physical or sexual violence | Emotional, physical or sexual violence | Number of women |
|----------------------------------------|--------------------|-------------------|-----------------|-----------------------------|----------------------------------------|-----------------|

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.

<sup>1</sup> Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals. The remaining households are non-nuclear households.

Table 15.12 Spousal violence by husband's characteristics and empowerment indicators

Percentage of ever-married women age 18-49 who have ever experienced emotional, physical, or sexual violence committed by their husband, according to his characteristics, marital characteristics, and selected empowerment indicators, India 2019-21

| Background characteristic                                                    | Emotional violence | Physical violence | Sexual violence | Physical or sexual violence | Emotional, physical or sexual violence | Number of women |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.

<sup>1</sup> Currently married women

<sup>2</sup> Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals. The remaining households are non-nuclear households.

Table 15.17 Help seeking

Note: An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

<sup>1</sup> Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals. The remaining households are non-nuclear households.

Table 15.18 Sources from where help was sought

Percentage of women age 18-49 who have ever experienced physical or sexual violence and have sought help from any source by source from which help was sought, according to the type of violence experienced, India 2019-21

| Source <sup>1</sup>         | Type of violence |             |                          | Total |
|-----------------------------|------------------|-------------|--------------------------|-------|
|                             | Physical only    | Sexual only | Both physical and sexual |       |
| Own family                  | 62.2             | 58.4        | 58.3                     | 60.9  |
| Husband's family            | 30.4             | 13.9        | 28.1                     | 29.3  |
| Current/former husband      | 1.0              | 3.6         | 1.9                      | 1.3   |
| Current/former boyfriend    | 0.4              | 1.1         | 0.3                      | 0.4   |
| Friend                      | 15.4             | 24.3        | 18.7                     | 16.6  |
| Neighbour                   | 7.8              | 3.6         | 9.7                      | 8.3   |
| Religious leader            | 2.6              | 0.5         | 2.0                      | 2.4   |
| Doctor/medical personnel    | 2.7              | 1.2         | 1.7                      | 2.4   |
| Police                      | 5.4              | 4.7         | 8.2                      | 6.3   |
| Lawyer                      | 2.4              | 0.0         | 1.6                      | 2.1   |
| Social service organization | 3.3              | 0.0         | 2.2                      | 2.9   |
| Other                       | 2.1              | 0.0         | 0.8                      | 1.7   |
| Number of women             | 1,983            | 54          | 949                      | 2,986 |

<sup>1</sup> Women can report more than one source from which they sought help.

## LIST OF CONTRIBUTORS

**Dr. K.S. James**, Director & Sr. Professor, International Institute for Population Sciences, Govandi Station Road, Deonar, Mumbai – 400 088, Maharashtra, India
